Parker Prädifa

ENGINEERING YOUR SUCCESS.

Parker-Prädifa Pneumatic Seals are the result of many years of compound and profile development experience, allowing the pneumatics engineer to pursue new design options and techniques such as selecting a friction-optimised sealing lip geometry which preserves the lubricating film.

A comprehensive portfolio of sealing systems for pneumatic cylinders is available to the application engineer: rod seals and wipers, single- and double-acting piston seals, complete pistons with or without mechanical dampers, cushioning rings as well as combined seal/wiper rings for ISO and short-stroke cylinders.
For special application requirements, as well, Parker offers a wide product range (partially included in this catalogue): seal/wiper elements for non-rotating cylinders, oval double-acting piston seals for flat cylinders, fleece-rubber seals for rodless cylinders and special seal/wiper elements for particularly dirty operating conditions.

In addition, Parker draws on years of experience in the field of valve sealing systems – particularly spool valves – thus being able to design the seal best suiting the customer's specific valve system and associated requirements.

Special compounds are available for pneumatic sealing solutions, combining the benefits of low friction, minimum wear and long service life. The variety of our compound range offers the right choice of material for any application and engineering requirement.

The Parker Seal Group´s extensive range of supporting facilities and expertise, including an accredited test lab, rubber and polyurethane compound development, physical lab and finite elements analysis, provides a solid base for customer-specific product developments.

For any requirements regarding the above, please contact our application engineers, who will be happy to assist you.

Warning - User responsibility

This document and other information from Parker Hannifin Corporation, its subsidiaries and authorized distributors provide product or system options for further investigation by users having technical expertise.

The user, through its own analysis and testing, is solely responsible for making the final selection of the system and components and assuring that all performance, endurance, maintenance, safety and warning requirements of the application are met. The user must analyze all aspects of the application, follow applicable industry standards, and follow the information concerning the product in the current product catalogue and in any materials provided from Parker or its subsidiaries or authorized distributors.
To the extent that Parker or its subsidiaries or authorized distributors provide component or system options based upon data or specifications provided by the user, the user is responsible for determining that such data and specifications are suitable and sufficient for all applications and responsibly foreseeable uses of the components or systems.

Range of Application

Our seals may only be used within the application parameters stated in our documents as regards compatibility with contact media, pressures, temperatures and time of storage. Application or use outside of the specified application parameters as well as the selection of different compounds by mistake may result in damage to life, the environment and/or equipment and facilities.

The information contained in our publications is based on know-how developed over decades of experience in the manufacturing and application of seals. Despite this experience, unknown factors arising out of the practical application of seals may considerably affect the overall applicability of this information in such a way that the recommendations provided herein are not to be considered generally binding.

The data for working pressure, working temperature, and surface speed stated in the columns represent maximum values and are interrelated. Under extreme working conditions it is recommended not to use all maximum values simultaneously.

For special requirements (pressure, temperature, speed, etc.) please contact our Consultancy Service, so that suitable materials and/or designs can be recommended.

Compatibility of Seals and Operating Media / Cleaning Agents

Due to the great diversity of operational parameters affecting fluidic devices and their impact on seals, it is absolutely imperative that manufacturers of these devices approve seals for functional and operational suitability under field conditions.

Furthermore, in view of the consistent increase of newly available media used as hydraulic oils, lubricants, and cleaning agents, special attention is invited to the aspect of compatibility with sealing elastomers currently in use.

Additives contained in base media in order to enhance certain functional characteristics may affect compatibility characteristics of sealing materials.

For this reason, it is imperative that any product equipped with our seals be tested for compatibility with operational media or cleaning agents approved or specified by you either at your plant or by means of field tests prior to any serial application.

We kindly ask you to comply with this notice since, as a manufacturer of seals, we are not in a position, as a matter of principle, to perform simulations regarding any and all conditions present in the final application nor of knowing the composition of the operational media and cleaning agents used.

Design modifications

We reserve the right to make design modifications without prior notification.

Prototypes and samples

Prototypes and samples are produced from experimental moulds. The subsequent series production may differ in production techniques from the prototype production unless specific agreement to the contrary was reached beforehand.

Delivery and services

The delivery guarantee (availability of moulds) for individual dimensions of our range of products is limited to a period of 7 years.

Damaged moulds, including standard items, can only be replaced in case of sufficient demand. Most of the dimensions stated in this catalogue are normally (but not as a matter of course) available ex stock.

For the production of smaller quantities, special compounds, and in case of special production procedures, we reserve the right of charging a prorated share of set-up costs.

All deliveries and services are subject to our terms.

Quality Systems

Our manufacturing sites are certified according to ISO 9001 resp. ISO/TS 16949.

For specific requirements, special compounds are available. Please contact our Consultancy Service.

1) Hardness values are average values, measured on standard specimen of 6 mm thickness acc. to DIN 53505. On finished parts, only micro hardness (IRHD-M) can typically be measured, which leads to different results.

2) The minus temperatures are provided as a general guideline only because functionality at low temperatures depends on seal design, operating conditions and the condition of adjoining metal parts. The plus temperatures stated depend on the application. They may be exceeded but will reduce service life accordingly. Short-term operation without loads, e.g. during painting processes, above the temperature limit is permissible. Long-term operation above the temperature limit will reduce service life. The use of aggressive media intensifies the degradation process.

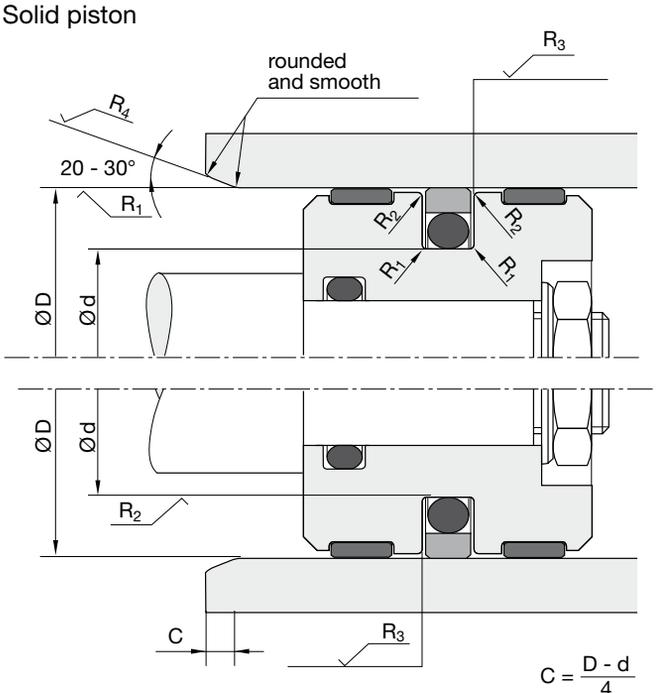
International (ISO) and national (DIN) standards for seal housing dimensions are in place and should be considered. For seals requiring a special groove, e. g. special seals, valve seals, rotor seals etc., the groove dimensions are stated separately. In general, the surface finishes, leading edge chamfers and dimensions stated here have already proved themselves and will mostly be found in the standards.

We recommend that customers adhere to the tolerances and surface finishes stated in this catalogue. This is a prerequisite for easy, damage-free installation and for the seal to retain the properties stated in this catalogue.

Surfaces: Grinding as final machining process for dynamic sealing surfaces is not sufficient. These surfaces have to be polished afterwards.

Radii: As for the necessary radii please refer to the respective profile data or the applicable standards.

Solid piston



Split piston

Surfaces

Dynamic sealing surfaces
For rubber and PTFE products
R_1: R_z 1,6 µm / R_a 0,4 µm
80 % ≤ $*t_{p1}$ ≤ 95 %

For polyurethane products
R_1: R_z 1,6 µm / R_a 0,4 µm
60 % ≤ $*t_{p1}$ ≤ 80 %

Static sealing surfaces
R_2 : R_z 6,3 µm / R_a 1,6 µm
$*t_{p2}$ ≥ 60 %

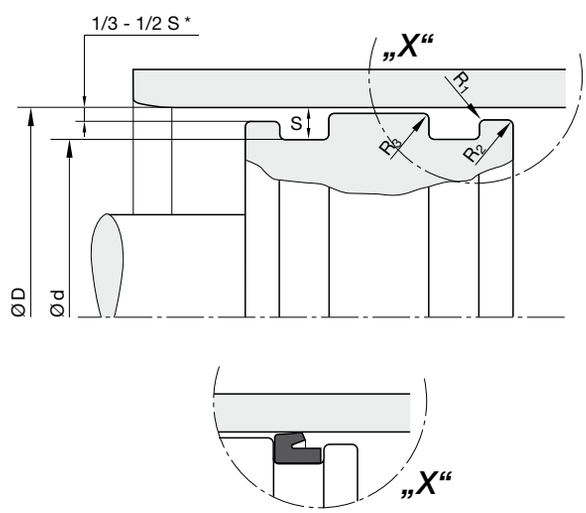
Non-sealing surfaces and lead-in chamfers
R_3: R_z 16 µm / R_a 4 µm
R_4: R_z 10 µm / R_a 1,6 µm

* Measured in a depth of 25 % of the R_t-value based on a reference level (zero line) set at 5 % bearing area.

Stretchable seals with tight fit

When seals have a tight fit the piston shoulder diameter can be reduced to ease assembly. By adapting this principal, metal to metal contact, caused by the piston contacting the cylinder wall surface under high transverse loads, is avoided.

Radii: As for the necessary radii please refer to the respective profile data or the applicable standards.



Complete Pistons

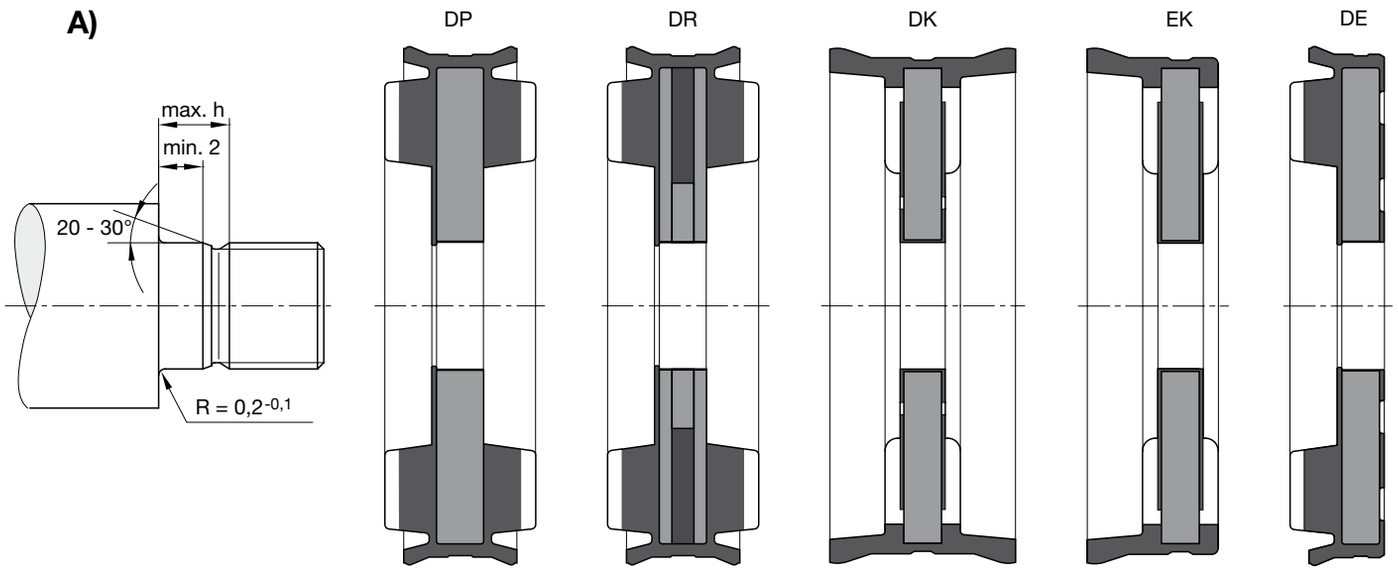
Installation for complete pistons
The Parker DP, DR and DE complete pistons have a sealing bead on one side of the inner diameter for reliable static sealing.
To take advantage of this sealing bead, the stated dimensions must be observed.

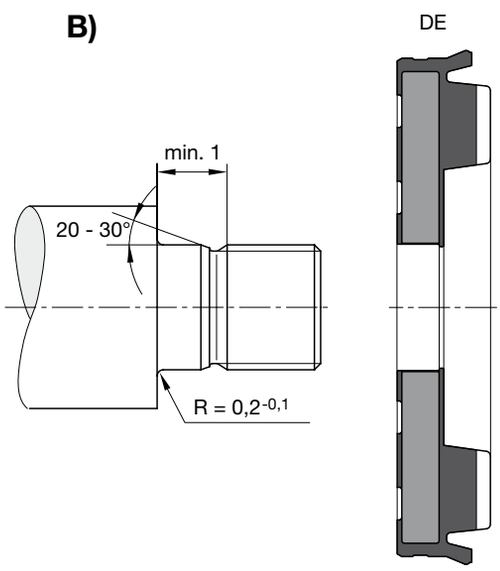
Assembly conditions
For the double-acting DP and DR complete pistons the short assembly version (A) may be selected. In this case the complete piston must be pushed onto the end of the piston rod with the sealing bead forwards during assembly.

If a single-acting DE complete piston is used and the application requires the sealing lip to be pointing away from the piston rod assembly version A may be used as well.

If the sealing lip of the DE points towards the piston rod, then the sealing bead must be on the side away from the piston rod and assembly version B is used. To bridge the lead-in chamfer and the thread undercut, a suitable back-up ring must be installed between the nut and the complete piston.

The DK and EK complete pistons have no inner sealing bead and can be installed like DR and DP. The orientation is immaterial in this case.





PTFE Seals

Installation guidelines for PTFE seals

The grooves must be carefully cleaned and deburred. The cylinder bore must have a leading edge chamfer. When fitting the piston sealing ring there is always the danger that the ring may tilt and be sheared off by normal leading edge chamfers (see fig. 1). We therefore recommend that up to a cylinder diameter of 230 mm a leading edge chamfer according to fig. 2 or detail »A« is considered. In the case of smaller rings which are especially liable to bending we recommend an open groove design for diameters smaller than 30 mm.

Fig. 1

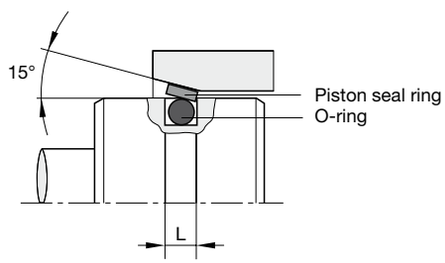


Fig. 2

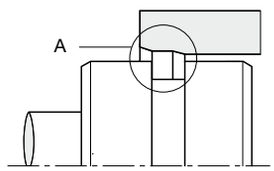
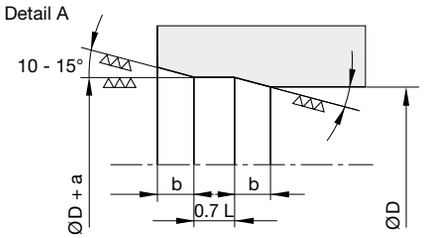


Detail A



Ø D	min. a	min. b
≤ 45	0.8	2.4
45 - 175	1.0	3.0
175 - 230	1.5	4.5

Assembly instruction for PTFE seals

Install the O-ring in the groove as per normal practice. Piston sealing rings of up to 100 mm diameter and wall thickness of over 1.6 mm should be “slowly” expanded and fitted with an assembly tool (see fig. 3). Pre-heating to 60 °C in hydraulic oil is advantageous. Larger rings can be expanded by hand. Uneven stretching or overstretching must under all circumstances be avoided.

Should it be necessary to draw the rings over existing guide ring grooves, then these grooves must be covered with plastic tape, or alternatively the expanding mandrel must reach the groove in question (see fig. 3). In this way it is ensured that the piston sealing ring does not snap into the wrong groove. The use of a burnishing shell is recommended when the assembly of a piston is made difficult by an overstretched ring or when the cylinder has an inadequate leading edge chamfer (see fig.4).

Assembly aids can be manufactured conveniently out of metal. However, in many cases polyamide or POM is also suitable.

Fig. 3

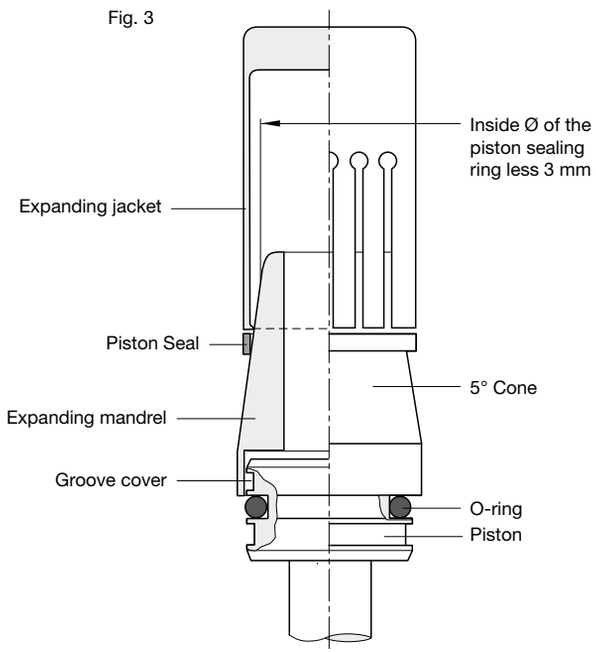


Fig. 4

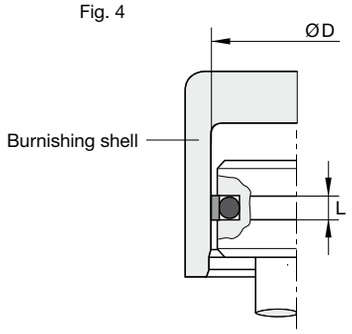
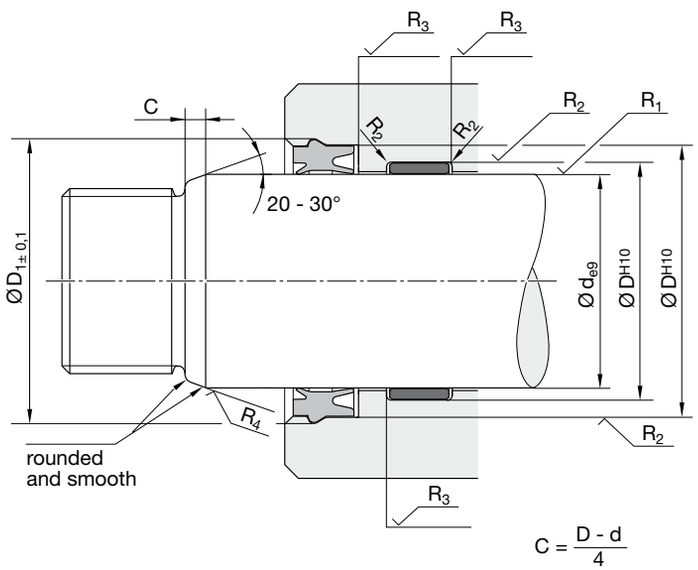


International (ISO) and national (DIN) standards for seal housing dimensions are in place and should be considered. For seals requiring a special groove, e. g. special seals, valve seals, rotor seals etc., the groove dimensions are stated separately. In general, the surface finishes, leading edge chamfers and dimensions stated here have already proved themselves and will mostly be found in the standards.

We recommend that customers adhere to the tolerances and surface finishes stated in this catalogue. This is a prerequisite for easy, damage-free installation and for the seal to retain the properties stated in this catalogue.

Surfaces: Grinding as final machining process for dynamic sealing surfaces is not sufficient. These surfaces have to be polished afterwards.

Radii: As for the necessary radii please refer to the respective profile data or the applicable standards.



Surfaces

Dynamic sealing surfaces
For rubber and PTFE products
R_1: R_z 1,6 µm / R_a 0,4 µm
80 % ≤ $*t_{p1}$ ≤ 95 %

For polyurethane products
R_1: R_z 1,6 µm / R_a 0,4 µm
60 % ≤ $*t_{p1}$ ≤ 80 %

Static sealing surfaces
R_2 : R_z 6,3 µm / R_a 1,6 µm
$*t_{p2}$ ≥ 60 %

Non-sealing surfaces and lead-in chamfers
R_3: R_z 16 µm / R_a 4 µm
R_4: R_z 10 µm / R_a 1,6 µm

* Measured in a depth of 25 % of the Rt-value based on a reference level (zero line) set at 5 % bearing area.

PTFE Seals

Installation guidelines for PTFE seals
The grooves must be carefully cleaned and deburred. The rods must have a lead-in chamfer (see picture on previous page).
We recommend open groove designs for rod diameters smaller than 30 mm as these rings are prone to breaking if deformed as above

Assembly instruction for PTFE seals
First the O-ring must be installed in the groove. Then the rod seal should be carefully formed into a kidney shape without sharp bends as shown in fig. 1. This deformed ring is placed in the groove and reformed rounded with the aid of a pin.

Fig. 1: Another type of installation aid. It consists of a metal pin which has a female cone-shaped recess at one of its front-ends. The PTFE ring can be easily placed in the recess deforming it by hand (see fig. 2). Due to the reduced diameter the PTFE ring (still placed on the pin) can now be installed into the groove. After removal of the pin the PTFE ring can be pressed into the groove and reformed.

Fig. 1

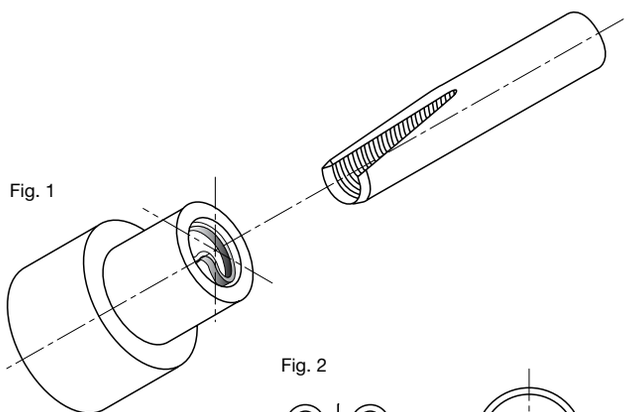


Fig. 2

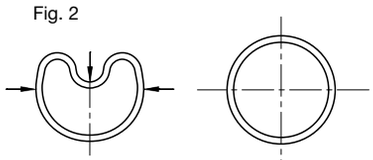


Pneumatic Seals
Parker Hannifin GmbH
Packing Division Europe

Definition

The maximum gap “e”, stated with the respective profile, stands for the maximum gap occuring between rod and guidance resp. between piston and cylinder exhausting all tolerances and maximum excentricity.

Conditions

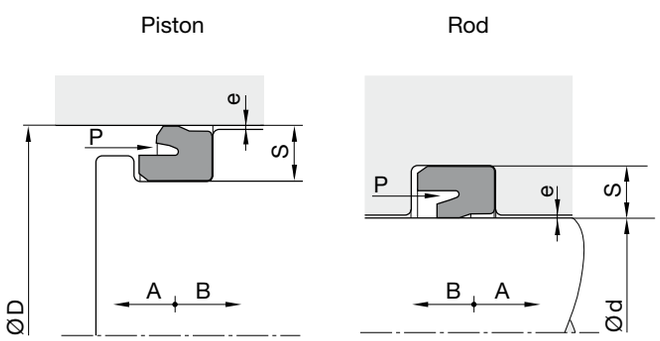
1. Surface quality according to our recommendations (see “General installation guidelines”).
2. Lubricating fluids.

For special conditions, e.g. nonlub fluids, water, acids, alcalies, please contact our Consultancy Service.

The nomographs in our catalogues have been developed for the “worst case”, that means pushing conditions (for the rod e.g. plunger conditions) and softest material in the corresponding group (e.g. 85 Shore A for polyurethanes and 70 Shore A for NBR).

If the application is not in a pushing mode, the extrusion gap can be increased by 25 %.

If instead of a 85 Shore A polyurethane a 93 Shore material or instead of a 70 Shore NBR a 85 Shore material is used, the extrusion gap can be increased by another 15 % (intermediate values to be balanced).



A = pushing
B = pulling

Example 1:
Polyurethane seals of Shore A ≥ 85 and cotton-reinforced seals

(see following pages)

d/D = Dynamic seal diameter = 63 mm*
S = Cross-section = 5 mm
P = Pressure = 10 bar
T = Temperature = 80 °C

* Insert the dynamic diameter and not the static one (groove diameter or tight fit). Means cylinder diameter for the piston seal (D) and rod diameter for the rod seal (d).

Method:
1. Draw a line connecting d/D to S and extend it until intersection with the line ξ1.
2. Draw a line connecting P to T and extend it until intersection with the line ξ2.
3. Connect the two intersections and read the allowable gap (0.71 mm) on scale »e«.

Example 2:
NBR, HNBR and FKM seals between 70 and 85 Shore A

(see following pages)

d/D = Dynamic seal diameter = 50 mm*
S = Cross-section = 5 mm
P = Pressure = 16 bar
T = Temperature = 50 °C

* Insert the dynamic diameter and not the static one (groove diameter or tight fit). Means cylinder diameter for the piston seal (D) and rod diameter for the rod seal (d).

Method:
1. Draw a line connecting d/D to S and extend it until intersection with the line ξ1.
2. Draw a line connecting P to T and extend it until intersection with the line ξ2.
3. Connect the two intersections and read the allowable gap (0.64 mm) on scale »e«.

The profile E5 rod seal is a lip seal specially developed for use in pneumatics. The dimensions of the standard E5 profile series correspond to the rod diameters according to ISO 3320 and CETOP RP 51 P and are fully interchangeable with the C1 profile standard series formerly used in pneumatics.

- Due to application-optimized geometry and compounds suitable for use in lubricated as well as in oil-free air (after initial lubrication on assembly).
- Robust seal profile for harshest operating conditions.
- Good wear resistance.
- Long service life thanks to application-optimized compounds.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed and undercut housings.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

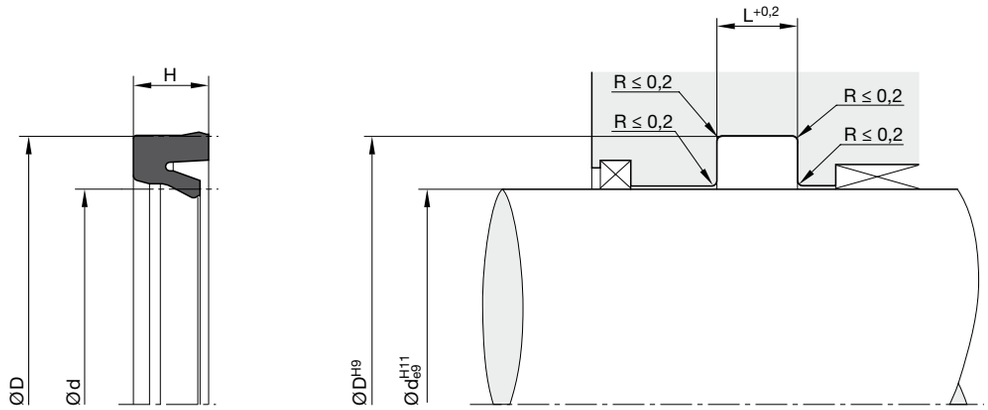
Standard: N3578, NBR compound (≈ 75 Shore A)
for low temperatures: N8602, NBR compound (≈70 Shore A)
for high temperatures: V8550, FKM compound (≈ 80 Shore A
Standard: P5010, PUR compound (≈ 90 Shore A)
for low temperatures: P5009, PUR compound (≈ 94 Shore A)

Installation

The profile E5 lip seals can be easily snapped into the groove. In order to prevent damage to the seal lips during assembly, any sharp edges in the vicinity of the groove must be removed. The dynamic seal lip will only acquire its ultimate functional size if the dimensions of the installation groove are properly machined after installation.
Under dry operating conditions it is absolutely essential to maintain a full lubrication film on the rod. This is ensured by appropriate initial lubrication. When using the profile E5 lip seal in pneumatic cylinders under non-lubricated conditions, a suitable wiper which does not destroy the lubrication film on the piston rod must be used. In this case, we recommend our profile A2 wiper specially designed for pneumatics.

Note: For nominal diameters ≤ 25 mm an open housing is recommended depending on the cross-section of the seal and the position of the groove (stuffing box installation).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The profile Z9 rod seal is a lip seal specially developed for use in pneumatics.

- Due to application-optimized geometry and compounds suitable for use in lubricated as well as in oil-free air (after initial lubrication on assembly).
- Good wear resistance.
- Low static and dynamic friction thanks to miniaturized design.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed and undercut housings.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-20 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

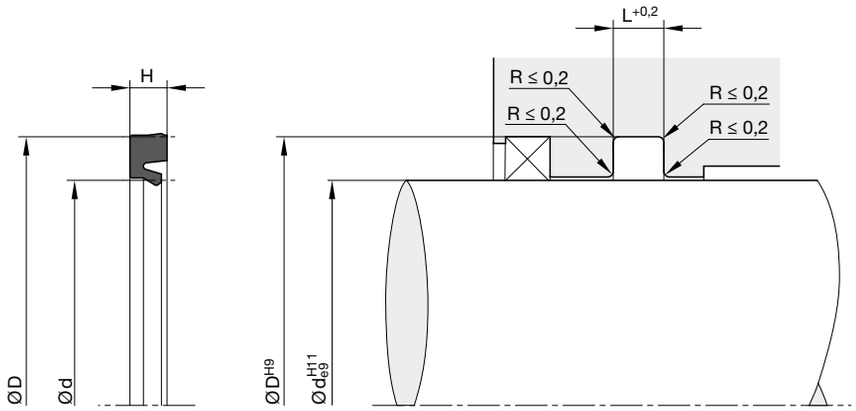
Standard: N3580, a special NBR-based SFR® elastomer (≈ 80 Shore A). This compound offers excellent running properties, especially in the semi-frictional area.
for low temperatures: N8602, NBR compound (≈ 70 Shore A)
for high temperatures: V3664, FKM compound (≈ 85 Shore A)

Installation

The profile Z9 lip seals can be easily snapped into the groove. To avoid damaging the seal lips during installation, sharp edges should be removed from around the installation groove. The groove dimensions determine the size of the dynamic lip. It is therefore essential to ensure that he groove is accurately machined. It is important to maintain a full lubrication film on the rod when running under non-lubricated conditions. Lubrication should take place during assembly. When using the profile Z9 lip seal under non-lubricated conditions, care should be taken to ensure that the lubrication film is not destroyed by the wiper. For this case we recommend our wiper profile A2, specially designed for pneumatics.

Note: For nominal diameters ≤ 25 mm an open housing is recommended, according to the cross-section of the sals and the position of the groove (stuffing box installation).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The profile C1 rod seal meets the requirements of the manufacturers of hydraulic and pneumatic equipment for seals with the smallest possible housings. Although cross-sections and heights are very small, the sealing performance is excellent.

Extremely low friction is experienced because of the short contact of the sealing surface area. Back-up rings or brackets are not required because of the special design.

Use in pneumatic equipment is only possible when consistent supply of lubricant such as oiled air is assured. For installation in non-lubricated pneumatic systems (dry air) we recommend our profile E5 which fits into the same housings.

- Good wear resistance.
- Easier installation.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Suitable compounds available for special requirements of the chemical process industry.
- Suitable compounds available for special requirements of the food processing industry.
- Installation in closed and undercut housings.

Range of Application

The profile C1 rod seal is especially recommended for plungers, piston rods, stems and valve lifters as well as for slowly operating pneumatic rotors ($v \leq 0{,}2$ m/s).

Working pressure [1]	
Hydraulics	≤ 160 bar
Pneumatics	≤ 16 bar
for rotary transmissions	≤ 20 bar
Working temperature	
Hydraulics	-35 °C to +100 °C
Pneumatics	-35 °C to +80 °C
Surface speed	
Hydraulics	≤ 0.5 m/s
Pneumatics	≤ 1 m/s
for rotary transmissions	≤ 0.2 m/s

Recommendation for rotary transmissions: $P \cdot v \leq 3$
(Definition see catalogue “Hydraulic Seals”, chapter “Other, Rotary Seals”, introduction.)

[1] Dependent upon cross-section and compound.

Compounds

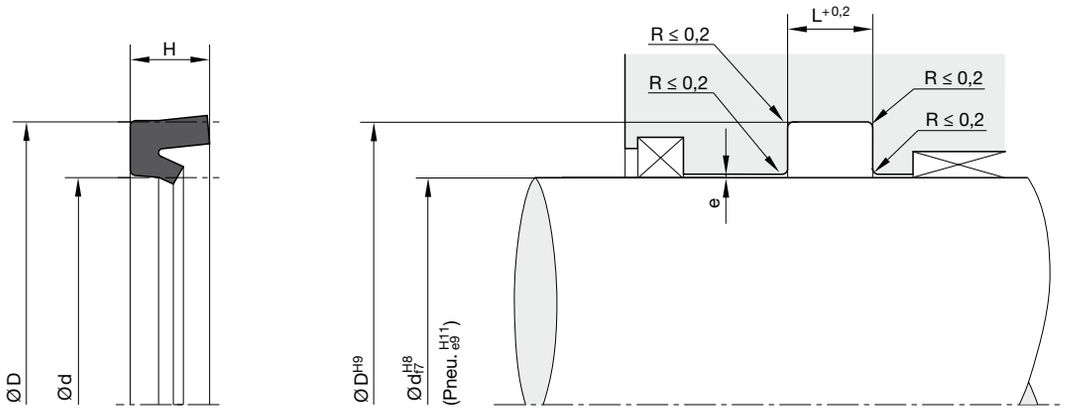
Standard: N3571, NBR compound (≈ 70 Shore A)
for low temperatures: N8602, NBR compound (≈ 70 Shore A)
for high temperatures: V3664, FKM compound (≈ 85 Shore A)

Installation

The profile C1 rod seals are manufactured over-sized on the external diameters in relation to the nominal dimensions. This ensures the required tight fit. Only after installation the sealing lip diameter will show the desired dimensions. Profile C1 can easily be snapped into the grooves.
When choosing a seal for a particular diameter, it is best to select the one with the largest possible cross-section.

Note: For nominal diameters ≤ 25 mm an open housing is recommended, according to the seals cross-section and the position of the groove (stuffing box installation).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



"e" see chapter "Maximum gap allowance"

Further sizes on request.

The self-retaining EU rod seal/wiper ring for pneumatic cylinder piston rods performs three functions simultaneously:
Sealing, Wiping, Fixing.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Robust seal profile for harshest operating conditions.
- Extreme wear resistance.
- No risk of corrosion since the combined retainer and wiper part eliminates the need for additional wire circlips.
- Long service life due to coordinated geometries of the functional lips and compound selection.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Excellent media resistance in case of suitable compound selection.
- Identical housing for E7, E8, E9, EU, EF and ET.
- Installation in open housings.
- Low compression set.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-35 °C to +80 °C [1)]
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

[1)] For higher temperatures, see profile E9.

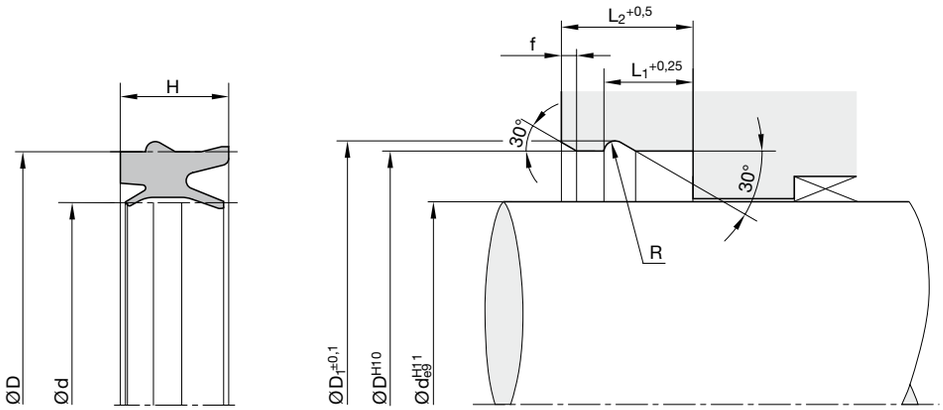
Compounds

Standard: P5008, PUR Compound (≈ 94 Shore A)
for low temperatures: P5009, PUR Compound (≈ 94 Shore A)

Installation

The profile EU rod seal wiper is pushed into the housing with a circlip recess conforming to DIN 7993 (type B) and retained by the easy-to-snap in retainer ridge.
During assembly, care should be taken that neither the wiper nor the sealing lip be damaged by being pushed over any sharp edges.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The self-retaining E7 rod seal/wiper is a version of the profil EU for extreme working conditions with regard to temperature and chemical resistance and dry running.
It performs three functions simulatenously:
Sealing, Wiping, Fixing.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Outstanding dry running propperties
- No risk of corrosion since the combined retainer and wiper part eliminates the need for additional wire circlips.
- Minimal break-away and dynamic friction and no stick-slip tendency ensures uniform motion even at low speeds.
- Easy snap assembly without assembly aids.
- Product geometry prevents dirt deposits at the front face of the cylinder.
- Identical housing for E7, E8, E9, EU, EF and ET.

Range of Application

Working pressure	≤ 16 bar
Working temperature	
E7 Z4017	-30 °C to +80 °C
E7 Z4016	-35 °C to +200 °C
Speed surface	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

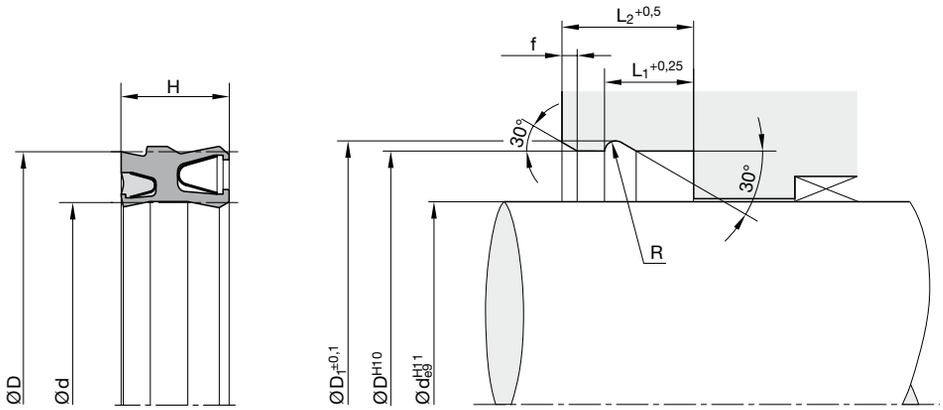
Compounds

Standard: Z4017 (Polon® 314, UHMW-PE)
for higher temperatures and/or chemical resistance requirements (but with slightly reduced service life): Z4016 (Polon® 074, PTFE + 10 % carbon fibre)

Installation

The rod seal/wiper E7 is pushed into the housing with a circlip recess conforming to DIN 7993 (type B) and retained by the easy-to-snap in retainer ridge. During assembly, care should be taken that neither the wiper nor the sealing lips be damaged by being pushed over any sharp edges.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The self-retaining pneumatic rod seal/wiper set profile E8 for piston rods in pneumatic cylinders combines three functions:
Sealing, Wiping, Fixing.

The split design of the sealing set allows optimal adaptation of the materials to the requirements of the individual component (wiper and/or seal).

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Good wear resistance.
- No risk of corrosion since the combined retainer and wiper part eliminates the need for additional wire circlips.
- Long service life due to coordinated geometries of the functional lips and compound selection.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Product geometry prevents dirt deposits at the front face of the cylinder.
- Identical housing for E7, E8, E9, EU, EF and ET.
- Installation in open housings.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-20 °C to +80 °C [1)]
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

[1)] For higher temperatures, see profile E9.

Compounds

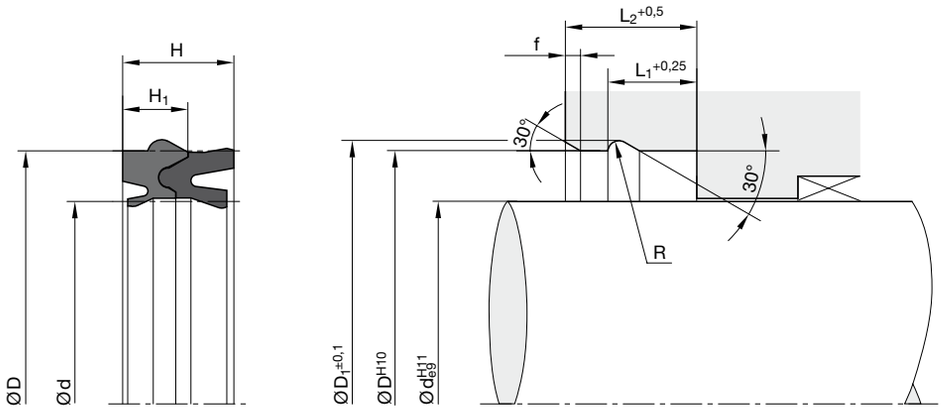
The sealing part of the profile E8 pneumatic rod seal/wiper is made of a special SFR® elastomer N3580 (NBR-based) with a hardness of approx. 80 Shore A.
This compound has excellent running properties, especially in the semi-frictional area.
The profile EA fixing/scraping part is made of the highly wear resistant W5035 plastic material.

Installation

The pneumatic profile E8 rod seal/wiper set is fitted into the housing by means of a circlip recess according to DIN 7993 (type B). The sealing part is pushed in and fixed by the EA retainer/wiper, which snaps in easily. During assembly, care should be taken to ensure that neither the scraper nor the sealing lips be damaged by sharp edges.

In case the seal/wiper set needs to be exchanged, this can be accomplished without removing the piston rod if a dismantling recess has been provided for.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The E9 pneumatic seal/wiper ring for pneumatic cylinder piston rods is the high-temperature version of the profiles E8 and EU.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Good wear resistance.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Identical housing for E7, E8, E9, EU, EF and ET.
- Installation in closed and undercut housings.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-10 °C to +150 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

Standard compound is a special FKM-based elastomer with a Shore hardness of approx. 81 A and a vulcanized metal disc (circlip according DIN 7993 type B).

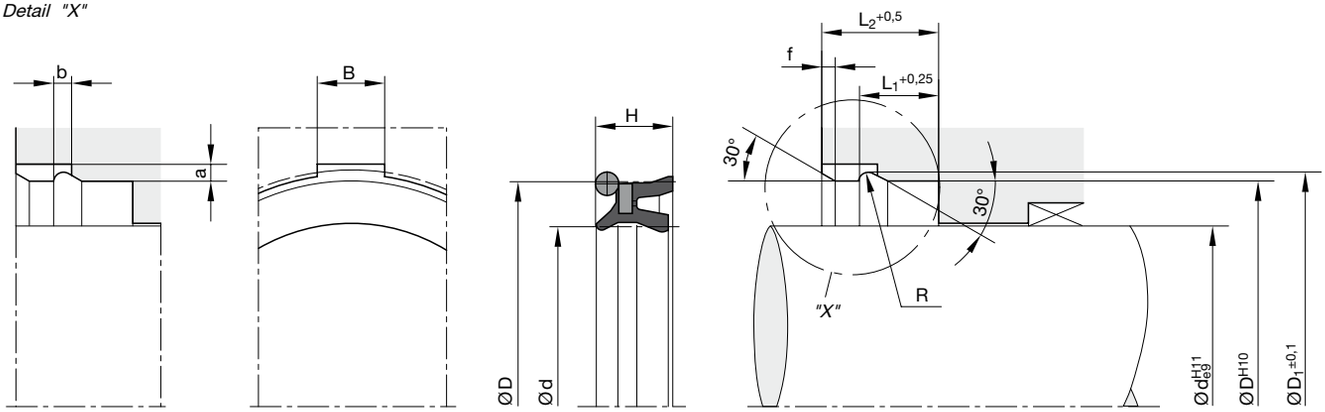
Installation

The pneumatic profile E9 rod seal/wiper set is fitted into the housing by means of a circlip recess according to DIN 7993 (type B). The sealing part is pushed in and fixed by the circlip.
During assembly, care should be taken to ensure that neither the scraper nor the sealing lips be damaged by sharp edges.

In case the seal/wiper set needs to be exchanged, this can be accomplished without removing the piston rod if a dismantling recess has been provided for (detail „X“).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Detail "X"



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The pneumatic rod seal/wiper profile EL is a tried and proven combined element for rods in small pneumatic cylinders and valve shafts.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Extreme wear resistance.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Excellent media resistance in case of suitable compound selection.
- Short axial assembly length.
- Installation in closed and undercut housings.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

Working pressure	
EL NBR N3582	≤ 10 bar
EL PUR P5008	≤ 16 bar
Working temperature	
EL NBR N3582	-10 °C to +80 °C
EL PUR P5008	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

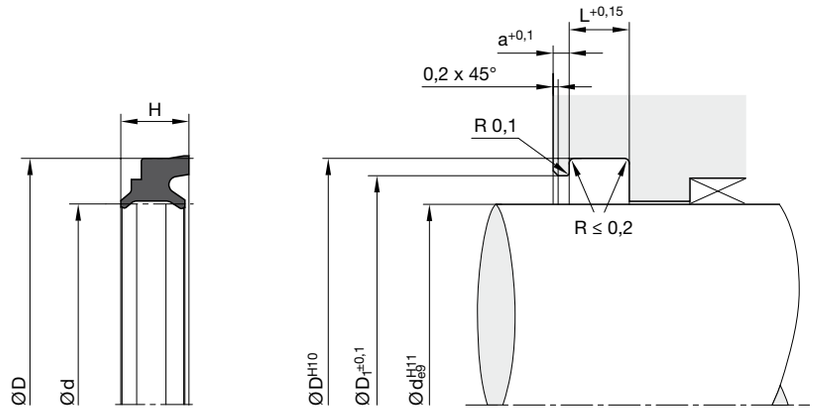
Compounds

Standard: N3582, a special NBR-based SFR® elastomer (≈ 85 Shore A). This compound offers excellent running properties, especially in the semi-frictional area.
for low temperatures: N8613, NBR compound (≈ 80 Shore A)
for high temperatures: V3839, FKM compound (≈ 90 Shore A)
Standard: P5008, PUR compound (≈ 94 Shore A)
for low temperatures: P5009, PUR compound (≈ 94 Shore A)

Installation

The selfretaining profile EL pneumatic and seal/wiper is easily snapped into the groove before the piston is assembled into the cylinder.
Care should be taken that the sealing and the wiper lips are not damaged by sharp edges during installation. Initial lubrication on assembly is important for very long service life.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The profile design of the profile EM rod seal/wiper combines the profile geometry of our tried and proven profile EL with the requirements of mini-pneumatics, i.e. the dimensions of profile EM are considerably smaller and friction values are even lower.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Extreme wear resistance.
- Low static and dynamic friction thanks to miniaturized design.
- Smooth running due to optimum adjustment of the functional lips.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Excellent media resistance in case of suitable compound selection.
- Short axial assembly length.
- Short radial assembly depth.
- Installation in closed and undercut housings.
- Low compression set.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

Rod seal/wiper for mini-pneumatics.

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

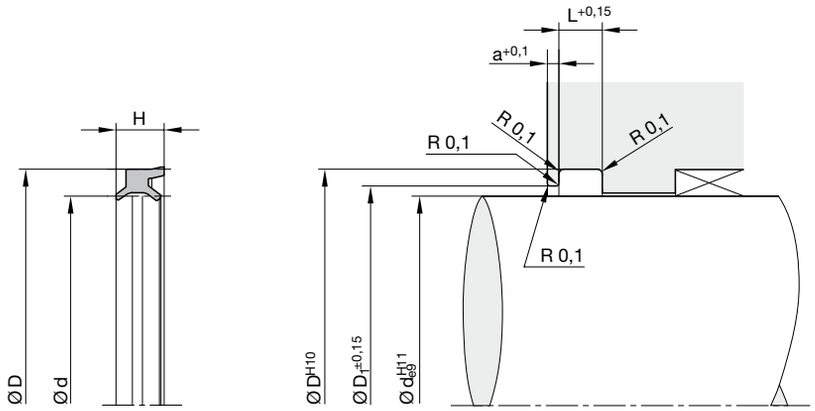
Compounds

Standard: P5010, PUR compound (≈ 90 Shore A)
for low temperatures: P5009, PUR compound (≈ 94 Shore A)
for high temperatures: V3839, FKM compound (≈ 90 Shore A)

Installation

The self-retaining rod seal/wiper profile EM is manually or automatically snapped into the installation housing while the piston rod is disassembled. Care is to be taken to prevent sharp edges from damaging the wiping and sealing lips during assembly. Initial lubrication is the prerequisite for very long operational life.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

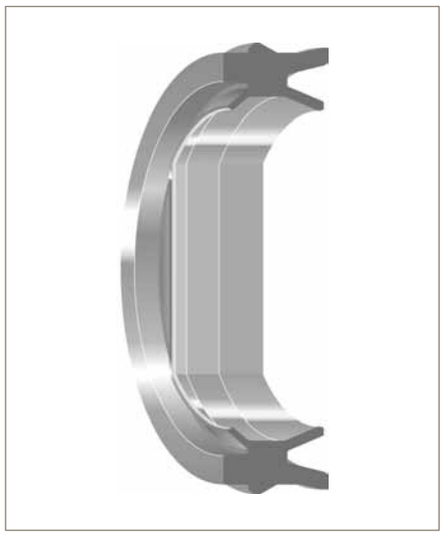
Further sizes on request.



The self-retaining ET rod seal/wiper ring for flattened piston rods in non-rotating pneumatic cylinders is the oval counterpart to the EU round standard profile. It performs three functions simultaneously:
Sealing, Wiping, Fixing.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Extreme wear resistance.
- No risk of corrosion since the combined retainer and wiper part eliminates the need for additional wire circlips.
- Long service life due to coordinated geometries of the functional lips and compound selection.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Excellent media resistance in case of suitable compound selection.
- Identical housing for E7, E8, E9, EU, EF and ET.
- Installation in open housings.
- Low compression set.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

For flattened rods of pneumatic cylinders protected against rotation.

Working pressure	≤ 10 bar
Working temperature	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

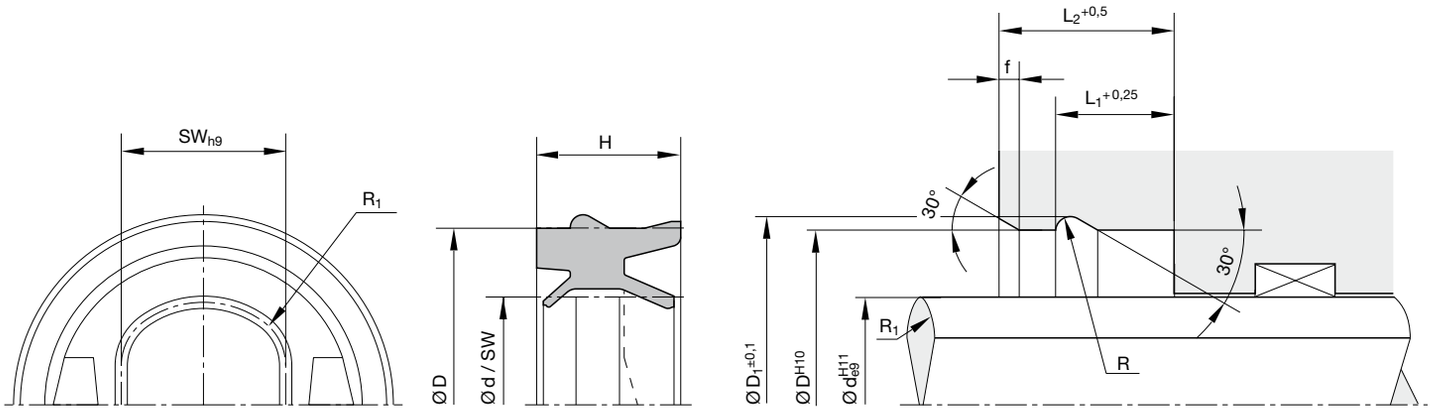
Compounds

Standard: P5008, PUR Compound (≈ 94 Shore A)
for low temperatures: P5009, PUR Compound (≈ 94 Shore A)

Installation

The profile ET rod seal/wiper is pushed into the housing with a circlip recess conforming to DIN 7993 (type B) and retained by the easy-to-snap in retainer ridge.
During assembly, care should be taken that neither the wiper nor the sealing lip be damaged by being pushed over any sharp edges.
The parallel surfaces of the guide sleeve and the seal must be accurately aligned with each other.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The self-retaining EF rod seal/wiper ring for flattened piston rods in non-rotating pneumatic cylinders is the oval counterpart to the EL round standard profile. It performs three functions simultaneously:
Sealing, Wiping, Fixing.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Bi-functional element: seal and wiper.
- Extreme wear resistance.
- Long service life due to coordinated geometries of the functional lips and compound selection.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Excellent media resistance in case of suitable compound selection.
- Product geometry prevents dirt deposits at the front face of the cylinder.
- Identical housing for E7, E8, E9, EU, EF and ET.
- Short axial assembly length.
- Installation in closed and undercut housings.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.

Range of Application

For flattened rods of pneumatic cylinders protected against rotation.

Working pressure	≤ 10 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

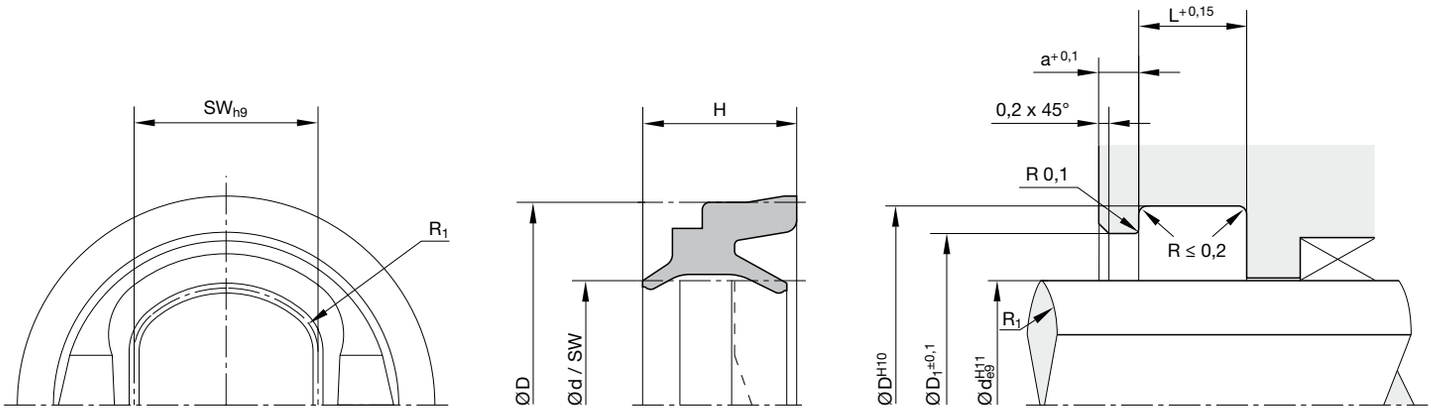
Compounds

P5010, PUR-Compound (≈ 90 Shore A)

Installation

During assembly, care should be taken that neither the wiper nor the sealing lip be damaged by being pushed over any sharp edges.
The parallel surfaces of the guide sleeve and the seal must be accurately aligned with each other.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The profile EP pneumatic rod seal, wiper and guidance system is used for rods in pneumatic cylinders. It combines the following functional features: **Sealing, Wiping, Fixing.**

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Multi-functional element: seal, wiper and guiding element.
- Extreme wear resistance.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Simple fabrication of the housing.
- Short radial assembly depth.
- Low compression set.
- The coordinated geometries of the seal and wiper lips achieve favourable friction coefficients and long service life.
- Multi-functionality provides warehousing cost benefits.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

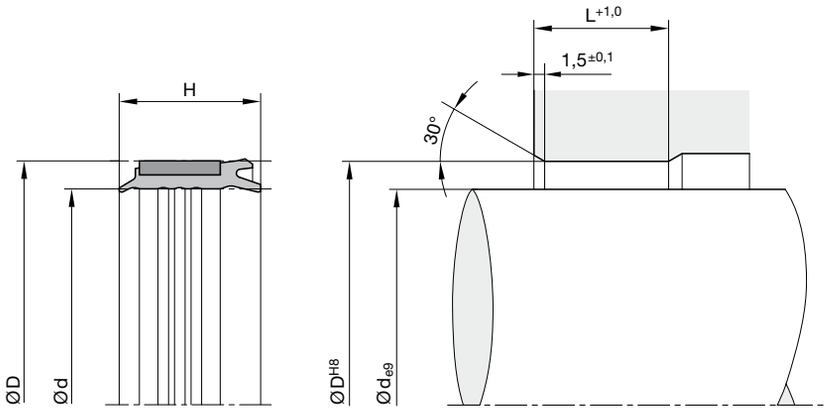
Compounds

The profile EP pneumatic rod seal, wiper and guidance system is made of a polyurethane compound (P5008) which we process in-house to ensure consistent quality.
The advantages of this compound are the high resistance to wear, the excellent compression set and the extended temperature range in comparison to conventional polyurethane compounds. The supporting/reinforcement part is made of an aluminum alloy chemically bonded to the polyurethane compound. Reinforcement parts made of other materials are available on request.

Installation

Profile EP is pressed into the bore and retained by a press fit between cylinder housing and an aluminum ring. Care should be taken that neither the scraper nor the sealing lips are damaged by sharp edges during installation. When pressing the sealing element into the groove, pressure should only be put upon the metal part. During a normal cylinder life span, replacement is not necessary. However, disassembly is possible after dismounting the cylinder head and forcing out the seal.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

E4 (NBR)

The profile E4 piston seal is a lip seal specially developed for use in pneumatics. The dimensions of the profile E4 standard series correspond to the cylinder diameters according to ISO 3320, CETOP RP 52 P, RP 43 P and RP 53 P. Profile E4 is fully interchangeable with the profile C2 standard series formerly used in pneumatics.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Suitable for cylinders with dead-center cushioning.
- Good wear resistance.
- Long service life thanks to application-optimized compounds.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- Suitable for fully automatic installation
- Assembly on one-part piston is possible.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed housings.
- Special seal geometry ensures optimal function even in case of flow-controlled exhaust air.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

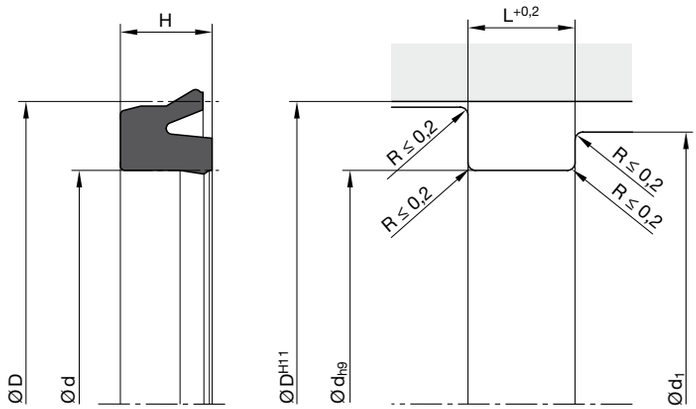
Compounds

Standard: N3578, NBR compound (≈ 75 Shore A)
for low temperatures: N8613, NBR compound (≈ 80 Shore A)
for high temperatures: V3664, FKM compound (≈ 85 Shore A)

Installation

The profile E4 lip seals are simply pulled over the piston into the groove. To avoid damaging the seal lips during installation, sharp edges should be removed from the piston and the cylinder tube.
Under oil-free conditions it is important to obtain a solid lubrication film inside the cylinder tube. This must be achieved before assembly to ensure a long service life of the seal.
For piston guidance we recommend the profile F2 piston guidance tape. Please refer to our profile F2 for details of the piston outside diameter and the gap measurements.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



d_1 = minimum piston diameter on pressure side

For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

E4 (PUR)

The profile E4 piston seal is a lip seal specially developed for use in pneumatics. The dimensions of the profile E4 standard series correspond to the cylinder diameters according to ISO 3320, CETOP RP 52 P, RP 43 P and RP 53 P. Profile E4 is fully interchangeable with the profile C2 standard series formerly used in pneumatics.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Suitable for cylinders with dead-center cushioning.
- Robust seal profile for harshest operating conditions.
- Extreme wear resistance.
- Long service life thanks to application-optimized compounds.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- Suitable for fully automatic installation
- Assembly on one-part piston is possible.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed housings.
- Low compression set.
- Pressure relief grooves at the back of the seal ensure optimal function even in case of flow-controlled exhaust air.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

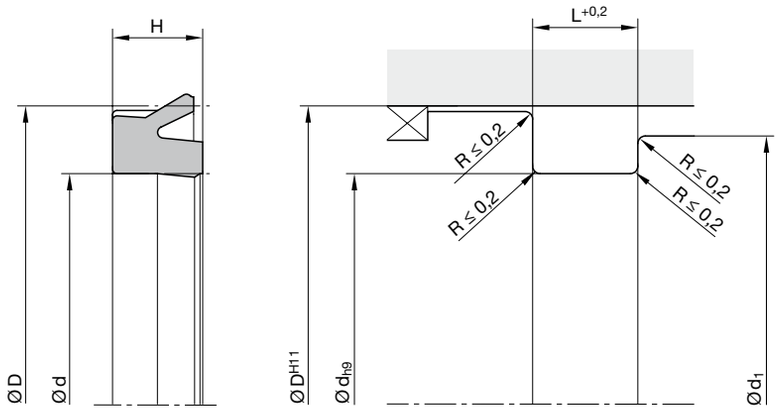
Compounds

Standard: P5007, PUR compound (≈ 82 Shore A)
for low temperatures: P5075, PUR compound (≈ 80 Shore A)

Installation

The profile E4 lip seals are simply pulled over the piston into the groove. To avoid damaging the seal lips during installation, sharp edges should be removed from the piston and the cylinder tube.
Under oil-free conditions it is important to obtain a solid lubrication film inside the cylinder tube. This must be achieved before assembly to ensure a long service life of the seal.
For piston guidance we recommend the profile F2 piston guidance tape. Please refer to our profile F2 for details of the piston outside diameter and the gap measurements.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



d_1 = minimum piston diameter on pressure side

For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The profile Z7 pneumatic piston seal is a U-ring with an integral guiding surface for single-acting pistons.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Multi-functional sealing element. The guiding area at the sealing element performs the guiding function in the cylinder. However, due to its geometry the sealing element is not suitable for absorption of high radial forces or long strokes.
- Prevents metallic contact between the piston and cylinder. Ideal for light-metal and plastic cylinders (ridging).
- Good wear resistance.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- Assembly on one-part piston is possible.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Installation in open housings with retaining collar.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

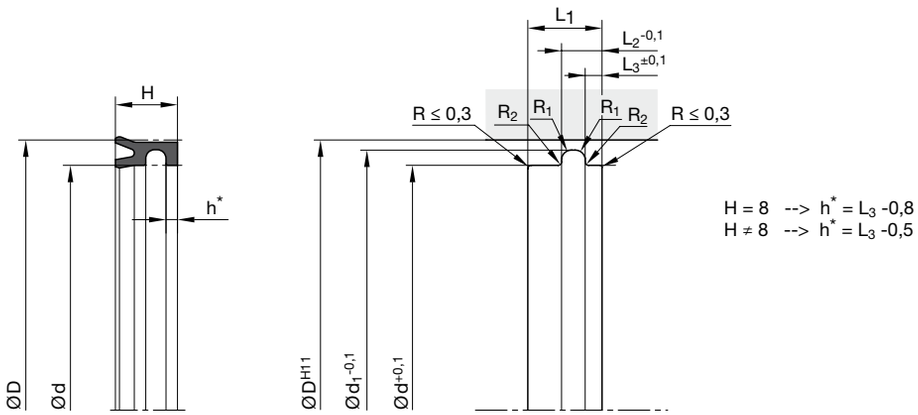
Compounds

Standard: N3578, NBR Compound (≈ 75 Shore A)
for low temperatures: N8602, NBR Compound (≈ 70 Shore A)
for high temperatures: V3681, FKM Compound (≈ 80 Shore A)

Installation

The profile Z7 pneumatic cylinder seals can be easily mounted by pulling them over the one-piece piston.
Care should be taken that all edges are chamfered to avoid seal damage.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Z8 (NBR)

The profile Z8 cylinder seal is a single-acting lip seal for pistons in pneumatic cylinders and valves. It requires small housing dimensions. The standard series of profile Z8 conforms to the cylinder diameters of ISO 3320 and CETOP RP 52 P, RP 43 P and RP 53 P.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Good sealing performance in extremely small assembly conditions.
- Good wear resistance.
- Low static and dynamic friction thanks to miniaturized design.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed and undercut housings.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-20 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

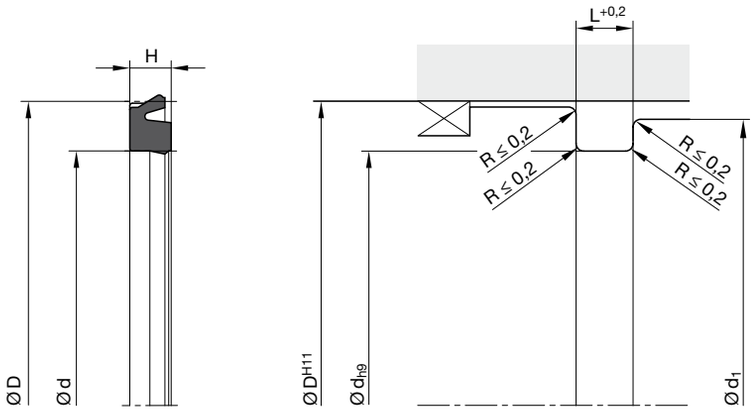
Compounds

Standard: N3580, a special NBR-based SFR® elastomer (≈ 80 Shore A). This compound offers excellent running properties, especially in the semi-frictional area.
for low temperatures: N8602, NBR compound (≈ 70 Shore A)
for high temperatures: V8550, FKM compound (≈ 80 Shore A)

Installation

Profile Z8 piston seals can be easily mounted into the grooves by simply pulling them over the piston. To avoid damaging the seals sharp edges should be removed from the piston and the cylinder tube.
For oil-frei operating conditions, it is important to obtain a full lubrication film inside the cylinder tube before assembly to ensure long service life of the seal.
For piston guidance we recommend our profile F2 piston guidance tape. For dimensions of pistons and clearances, please refer to our profile F2.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



d_1 = minimum piston diameter on pressure side

For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Z8 (PUR)

The profile Z8 cylinder seal is a single-acting lip seal for pistons in pneumatic cylinders and valves. It requires small housing dimensions. The standard series of profile Z8 conforms to the cylinder diameters of ISO 3320 and CETOP RP 52 P, RP 43 P and RP 53 P.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Good sealing performance in extremely small assembly conditions.
- Extreme wear resistance.
- Low static and dynamic friction thanks to miniaturized design.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed and undercut housings.
- Low compression set.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

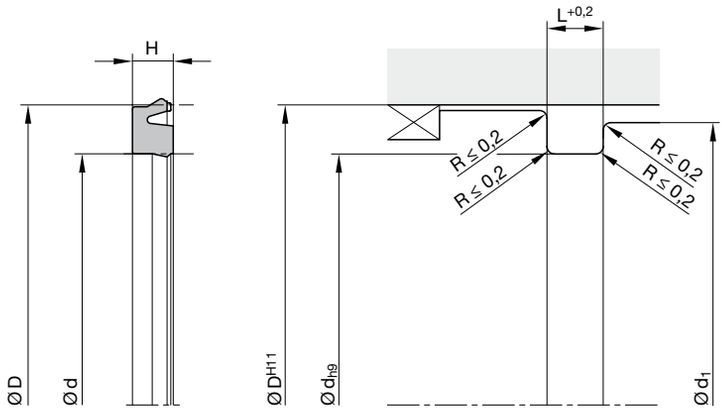
Standard: P5007, PUR compound (≈ 82 Shore A)
for low temperatures: P5075, PUR compound (≈ 80 Shore A)

Installation

Profile Z8 piston seals can be easily mounted into the grooves by simply pulling them over the piston. To avoid damaging the seals sharp edges should be removed from the piston and the cylinder tube.
For oil-free operating conditions, it is important to obtain a full lubrication film inside the cylinder tube before assembly to ensure long service life of the seal.
For piston guidance we recommend our profile F2 piston guidance tape. For dimensions of pistons and clearances, please refer to our profile F2.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Z8 (PUR)



d_1 = minimum piston diameter on pressure side

For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

200	180	8.25	8.5	198.8	Z8 L018 P5007

Further sizes on request.

The profile C2 piston seal meets the requirements of the manufacturers of hydraulic and pneumatic equipment for seals with the smallest possible housings. Although cross-sections and heights are very small the sealing performance is excellent.

Extremely low friction is experienced because of the short contact to the sealing surface area. Because of the special design, back-up rings or brackets are not required.

Use in pneumatic equipment is only possible when consistent supply of lubricant such as oiled air is assured. For installation in non-lubricated pneumatic systems (dry air) we recommend our profile E4 which fits into the same housings.

- Good wear resistance.
- Easier installation.
- Suitable for fully automatic installation
- Assembly on one-part piston is possible.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Suitable compounds available for special requirements of the chemical process industry.
- Suitable compounds available for special requirements of the food processing industry.
- Installation in closed and undercut housings.

Range of Application

Especially recommended for pistons in hydraulic and pneumatic cylinders.

Working pressure [1]	
Hydraulics	≤ 160 bar
Pneumatics	≤ 16 bar
Working temperature	
Hydraulics	-25 °C to +100 °C
Pneumatics	-25 °C to +80 °C
Surface speed	≤ 0.5 m/s

[1] Dependent upon cross-section and compound.

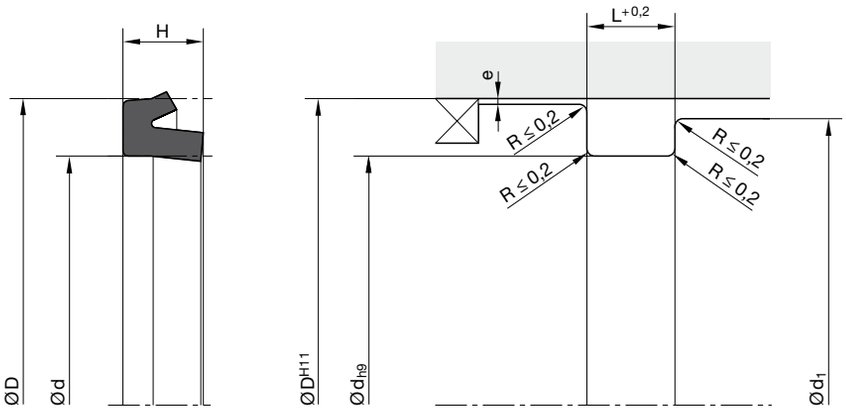
Compounds

Standard: N3584, NBR compound (≈ 85 Shore A)
for low temperatures: N8613, NBR compound (≈ 80 Shore A)
for high temperatures: V3664, FKM compound (≈ 85 Shore A)

Installation

The profile C2 piston seals are manufactured undersized in relation to the nominal dimensions. Only after installation will the sealing lip diameter have the desired dimensions. This lip seal may easily be snapped into the grooves. Care should be taken that the seals are not pulled over sharp edges.
In the case of double-acting pistons, pressure peaks should be avoided. In such cases, sealing elements with larger cross-sections or other profiles with header rings should be used.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



"e" see chapter "Maximum gap allowance"
d_1 = minimum piston diameter on pressure side

The PDF Ultrathan® piston seal profile MK is a sealing element with integrated guiding and cushioning buffers. This seal-guide element can be used both on pistons with or without a permanent magnet. When used in magnetic pistons, the seal-guide element encapsulates the permanent magnet.

- The asymmetrical retention groove ensures optimum positive connection between the sealing element and the piston.
- Cushioning buffers on the piston´s front faces with integrated ventilation ducts provide for mechanical cushioning of the cylinders.
- Multi-functional sealing element. The guiding area at the sealing element performs the guiding function in the cylinder. However, due to its geometry the sealing element is not suitable for absorption of high radial forces or long strokes.
- Multi-functional element: seal, guiding and cushioning element.
- Optimal front-side sealing effect due to favourable cushioning buffer geometry.
- Prevents metallic contact between the piston and cylinder. Ideal for light-metal and plastic cylinders (ridging).
- Long service life thanks to application-optimized compounds.
- Easier installation.
- Assembly on one-part piston is possible.
- Excellent media resistance in case of suitable compound selection.
- Low compression set.

Range of Application

Working pressure	≤ 12 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

Standard: P5010, PUR Compound (≈ 90 Shore A)
for low temperatures: P5075, PUR Compound (≈ 80 Shore A)
for high temperatures: V3664, FKM Compound (≈ 85 Shore A)

Installation

The MK piston seal features easy snap-on assembly with the retention groove for 12 to 25 mm diameters being machined into the piston rod. In order to prevent damage to the sealing lips during assembly, it is necessary to break sharp edges at the piston and cylinder. Under dry operating conditions, it is imperative to apply a continuous full-surface lubricating film inside the cylinder for achieving long service life. Because the seal itself also serves as a guide, additional guidance is not required.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Typ 1: D < 32 mm

Further sizes on request.

The profile Z5 pneumatic piston seal is a double U-ring with an integral guiding surface for double-acting pistons.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Multi-functional sealing element. The guiding area at the sealing element performs the guiding function in the cylinder. However, due to its geometry the sealing element is not suitable for absorption of high radial forces or long strokes.
- Prevents metallic contact between the piston and cylinder. Ideal for light-metal and plastic cylinders (ridging).
- Good wear resistance.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easier installation.
- Assembly on one-part piston is possible.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Installation in open housings with retaining collar.

Range of Application

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

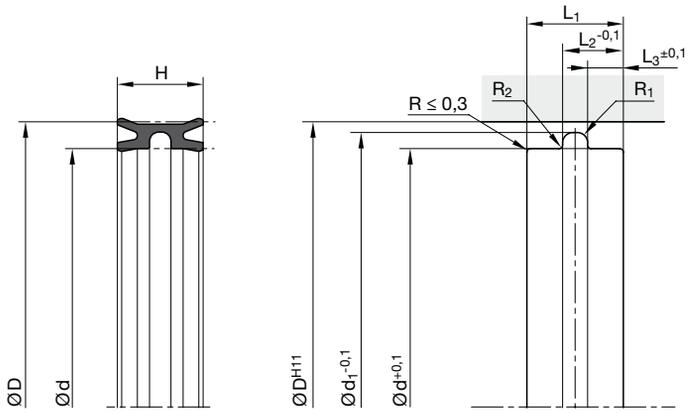
Compounds

Standard: N3578, NBR compound (≈ 75 Shore A)
or low temperatures: N8602, NBR compound (≈ 70 Shore A)
for high temperatures: V8550, FKM compound (≈ 80 Shore A)

Installation

The profile Z5 pneumatic cylinder seals can be easily mounted by pulling them over the one-piece piston.
Care should be taken that all edges are chamfered to avoid seal damage.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The profile PZ pneumatic piston seal has been developed for use in pneumatic cylinders and in valves. The double-acting piston seal requires only small housing dimensions.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Good sealing performance in extremely small assembly conditions.
- Can also be used for single-acting applications.
- Good wear resistance.
- Low static and dynamic friction thanks to miniaturized design.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Suitable for fully automatic installation
- Assembly on one-part piston is possible.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Short axial assembly length.
- Installation in closed housings.

Range of Application

Working pressure	≤ 12 bar
Working temperature	-20 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

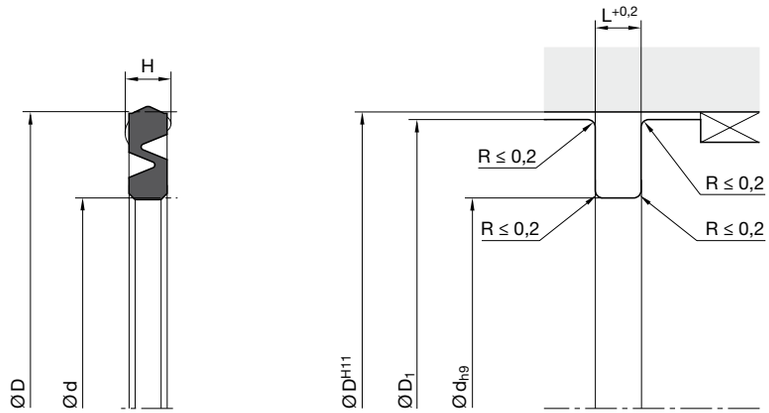
Compounds

Standard: N3571, NBR compound (≈ 70 Shore A)
for low temperatures: N8602, NBR compound (≈ 70 Shore A)
for high temperatures: V3681, FKM compound (≈ 80 Shore A)

Installation

The profile PZ pneumatic piston seals can be easily mounted into the grooves by simply pulling them over the piston.
To avoid damaging the seal, sharp edges should be removed from the piston and the cylinder tube.
For oil-free conditions, it is important to obtain a full lubrication film inside the cylinder tube prior to assembly to ensure long service life of the seal.
For piston guidance, we recommend our profile F2 piston guidance tape. For dimensions of pistons and clearances, please refer to our profile F2.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The double-acting piston sealing set profile OA consists of a PTFE piston sealing ring and an elastomer O-ring as a preloading element.

Profile OA is particularly suitable for double-acting pneumatic pistons, e.g. in control cylinders, servo-assisted equipment and in quick-acting cylinders.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Good sealing performance in extremely small assembly conditions.
- Can also be used for single-acting applications.
- Good wear resistance.
- Minimal break-away and dynamic friction and no stick-slip tendency ensures uniform motion even at low speeds.
- Good energy efficiency due to low friction.
- Very good emergency running properties in low-lube conditions.
- Assembly on one-part piston is possible.
- High temperature resistance assured by suitable O-ring compound selection.
- Adaptable to nearly all media thanks to high chemical resistance of the sealing ring and large O-ring compound selection.
- Short axial assembly length.
- Installation in closed and undercut housings.
- Available in diameters from 4 to 3000 mm.
- Machined small-volume series and samples available with short lead times.

Range of Application

Piston sealing set for pneumatic applications.

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C [1)]
Surface speed	≤ 4 m/s

[1)] With deviation from standard temperature range, please contact our Consultancy Service for adequate O-Ring compound.

Compounds

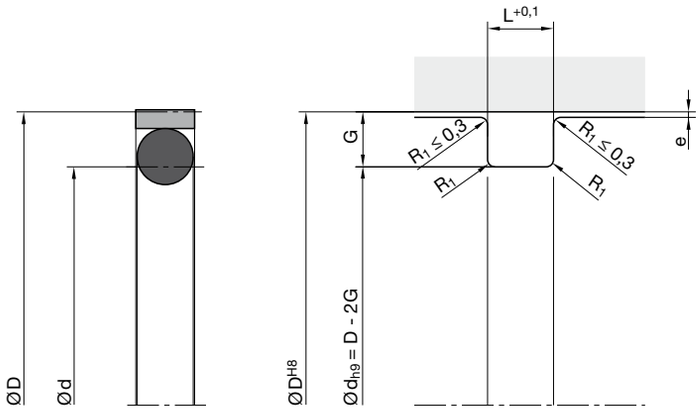
Sealing ring: Polon® 033, modified PTFE + 25 % carbon
O-ring: N0674, NBR elastomer with approx. 70 Shore A.

Installation

The grooves must be carefully cleaned and deburred. The cylinder bore must have a lead-in chamfer. When fitting the piston sealing ring there is always a risk that the ring may tilt and be sheared off by normal lead-in chamfers (see chapter “General installation guidelines for piston seals”, PTFE seals, fig. 1). We therefore recommend that up to a cylinder diameter of 230 mm a lead-in chamfer according to fig. 2 or detail “A” is considered. In the case of smaller rings which are especially liable to bending we recommend an open-groove design for diameters smaller than 30 mm.

This seal should only be used in combination with guiding elements (e.g. profile F2).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The single-acting profile EK is a complete pneumatic piston with a cup seal and a vulcanized metal disc support. It performs two functions:
Sealing and guiding.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Immediate response (full pressure load) thanks to incorporated venting channels.
- Good wear resistance.
- Ideal corrosion protection thanks to complete elastomer covering.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- Easy attachment to the piston rod without additional sealing elements.
- Easy installation due to integrated static sealing function.
- Excellent media resistance in case of suitable compound selection.
- Also available as double-acting version.
- Low assembly height of the complete piston enables short cylinder designs.
- Versatile complete piston for nearly all cylinder designs.

Range of Application

Complete piston for single-acting pneumatic cylinders with and without cushioning, provided that no excessive lateral guidance loads will occur (long strokes and buckling).

Working pressure	≤ 16 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

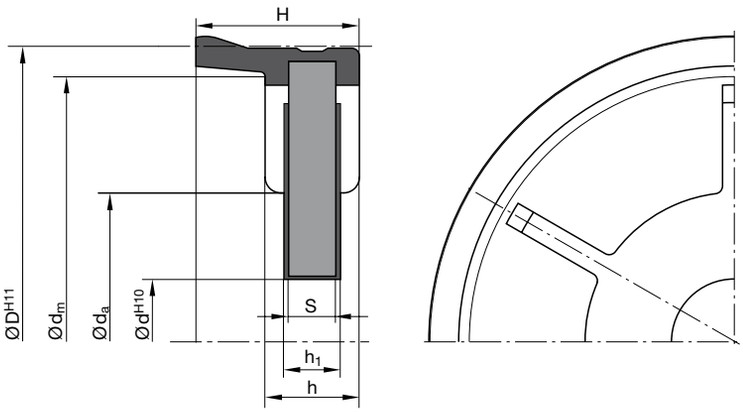
Compounds

Standard compound is an elastomer (NBR-based) with a hardness of approx. 71 Shore A and vulcanized to a metal disc, resp. 78 Shore A for diameters > 100 mm.

Installation

The profile EK complete piston is fixed to the piston rod with a locknut to avoid loosening. For use with dry and oil-free air, the piston and cylinder tube must be prelubricated with a suitable long-life lubricant.
It must be assured that the sealing lips do not touch the cylinder bottom and the cylinder cap at the limit stops (see also dimension „Ø d_m“).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



Ø d_m = max. Ø of joining metal parts

For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The single-acting profile DE is a complete pneumatic piston with a cup seal and a vulcanized metal disc support. It performs three functions:
Sealing, guiding and cushioning.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Cushioning buffers on the piston´s front faces with integrated ventilation ducts provide for mechanical cushioning of the cylinders.
- Multi-functional element: seal, guiding and cushioning element.
- Immediate response (full pressure load) thanks to incorporated venting channels.
- Good wear resistance.
- Ideal corrosion protection thanks to complete elastomer covering.
- Smooth running due to optimum adjustment of the functional lips.
- Easy attachment to the piston rod without additional sealing elements.
- Easy installation due to integrated static sealing function.
- Excellent media resistance in case of suitable compound selection.
- Also available as double-acting version.
- Low assembly height of the complete piston enables short cylinder designs.
- Versatile complete piston for nearly all cylinder designs.

Range of Application

Complete piston for single-acting pneumatic cylinders with end cushioning, provided that no excessive lateral guidance loads will occur (long strokes and buckling).

Working pressure	≤ 12 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

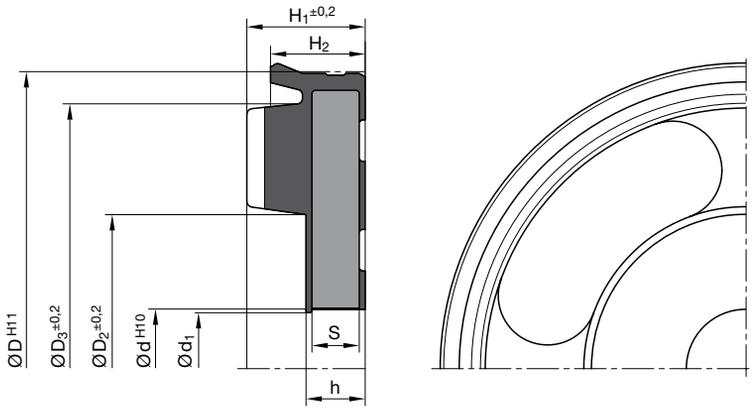
Standard compound is an elastomer (NBR-based) with a hardness of approx. 71 Shore A and vulcanized to a metal disc.

Installation

The profile DE complete piston is fixed to the piston rod with a locknut to avoid loosening. For use with dry and oil-free air, the piston and cylinder tube must be prelubricated with a suitable long-life lubricant.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Complete piston with integrated cushioning



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Further sizes on request.

The double-acting profile DK is a complete pneumatic piston with a double cup seal and a vulcanized metal disc support. It performs two functions: **Sealing and guiding.**

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Immediate response (full pressure load) thanks to incorporated venting channels.
- Good wear resistance.
- Ideal corrosion protection thanks to complete elastomer covering.
- Smooth running due to optimum adjustment of the functional lips.
- Easy attachment to the piston rod without additional sealing elements.
- Easy installation due to integrated static sealing function.
- Excellent media resistance in case of suitable compound selection.
- Low assembly height of the complete piston enables short cylinder designs.
- Versatile complete piston for nearly all cylinder designs.

Range of Application

Complete piston for double-acting pneumatic cylin-ders with and without cushioning, provided that no excessive lateral guidance loads will occur (long strokes and buckling).

Working pressure	≤ 16 bar
Working temperature	
DK NBR Z5051	-30 °C to +80 °C
DK PUR Z5071	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

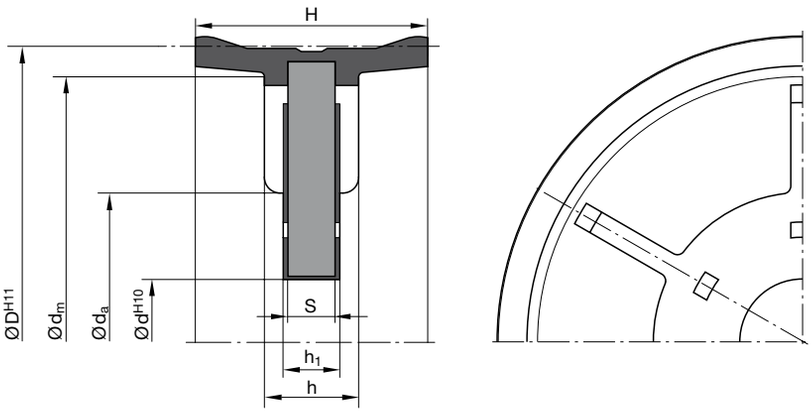
Compounds

Standard compound is an elastomer (NBR-based) with a hardness of approx. 71 Shore A and vulcanized to a metal disc, resp. 78 Shore A for diameters > 100 mm.
For high and/or low temperature applications special compounds are available.
Available sizes in the polyurethane compound P5008 are listed separately.

Installation

The profile DK pneumatic complete piston is fixed to the piston rod with a locknut to avoid loosening. For use with dry and oil-free air, the piston and cylinder tube must be prelubricated with a suitable long-life lubricant.
It must be assured that the sealing lips do not touch the cylinder bottom and the cylinder cap at the limit stops (see also dimension „Ø d_m“).

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



Ø d_m = max. Ø of joining metal parts

For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The double-acting profile DP is a complete pneumatic piston with a double cup seal and a vulcanized metal disc support. It performs three functions: **Sealing, guiding and cushioning.**

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Cushioning buffers on the piston´s front faces with integrated ventilation ducts provide for mechanical cushioning of the cylinders.
- Multi-functional element: seal, guiding and cushioning element.
- Immediate response (full pressure load) thanks to incorporated venting channels.
- Good wear resistance.
- Ideal corrosion protection thanks to complete elastomer covering.
- Smooth running due to optimum adjustment of the functional lips.
- Easy attachment to the piston rod without additional sealing elements.
- Easy installation due to integrated static sealing function.
- Excellent media resistance in case of suitable compound selection.
- Low assembly height of the complete piston enables short cylinder designs.
- Versatile complete piston for nearly all cylinder designs.

Range of Application

Complete piston with end cushioning for double-acting pneumatic cylinders, provided that no excessive lateral guidance loads will occur (long strokes and buckling).

Working pressure	≤ 12 bar
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

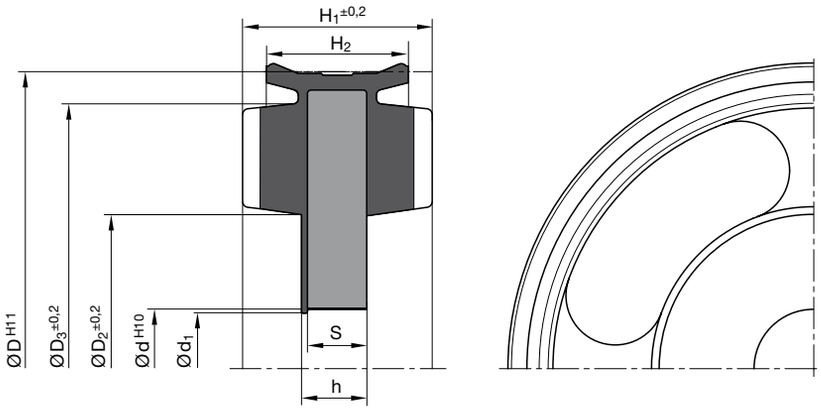
Standard compound is an NBR-based elastomer with a hardness of approx. 71 Shore A and vulcanized to a metal disc.

Installation

The profile DP pneumatic complete piston should be fixed to the piston rod with a locknut to avoid loosening. For use with dry and oil-free air, the piston and cylinder tube must be prelubricated with a suitable long-life lubricant.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Complete piston with integrated cushioning



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The double-acting pneumatic complete piston DR with inductive position interrogation and integrated cushioning is specifically designed to meet the requirements of modern pneumatic cylinders. The extremely slim complete piston is suitable for use in a wide range of different cylinder types and with various sensors.
The combination of all functionalities sealing, guiding, cushioning, interrogating in a single component assures easy assembly and, in addition, offers handling and logistic cost benefits.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Use of different types of sensors (inductive) is possible.
- Cushioning buffers on the piston´s front faces with integrated ventilation ducts provide for mechanical cushioning of the cylinders.
- Multi-functional element: seal, guiding and cushioning element.
- Immediate response (full pressure load) thanks to incorporated venting channels.
- Good wear resistance.
- Ideal corrosion protection thanks to complete elastomer covering.
- Smooth running due to optimum adjustment of the functional lips.
- Easy attachment to the piston rod without additional sealing elements.
- Easy installation due to integrated static sealing function.
- Excellent media resistance in case of suitable compound selection.
- Low assembly height of the complete piston enables short cylinder designs.
- Versatile complete piston for nearly all cylinder designs.

Range of Application

Complete piston with end cushioning for double-acting pneumatic cylinders, provided that no excessive lateral guidance loads will occur (long strokes and buckling).

Working pressure	≤ 12 bar
Working temperature	-20 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

Compounds

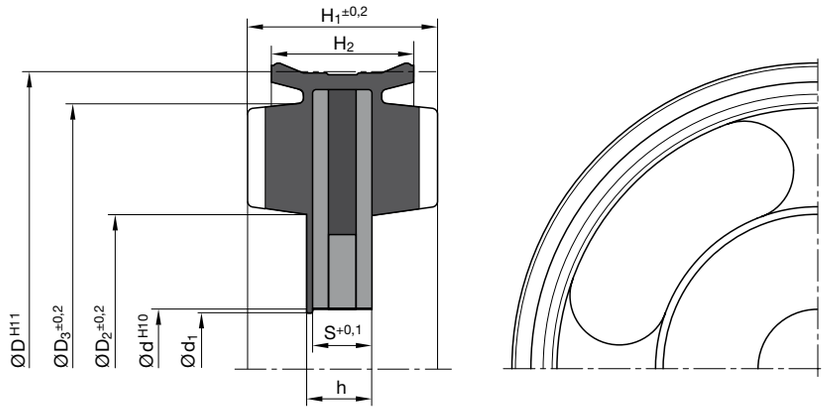
Standard compound is an NBR-based elastomer with a hardness of approx. 70 Shore A with vulcanised metal, magnet and reinforcing discs.

Installation

The magnetic piston DR is connected to the piston rod by threading or riveting. The threaded connection should be secured against loosening. For operation in dry or oil-free air, a long-term lubricant must be used for the piston and cylinder.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Further sizes on request.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

	F2	99
O-rings		
	V1	103

The function of the pneumatic wiper rings A2 is to prevent dust, dirt, grains of sand and metal shavings from entering the dynamic rod guide. This is achieved by a special design which largely prevents the development of dents, protecting the guiding parts, and extending the working life of the seals.

These wipers were specially developed for pneumatic equipment operated with dry air or oil-free air. It is essential that these wipers be pregreased prior to installation.

Oversized diameters ensure a tight fit in the groove recess, thus preventing the penetration of foreign particles and dampness.

The profile A2 pneumatic wiper ring provides a technically proper closure at the cylinder requiring no screwings brackets, close tolerances, and no metal inserts. There will be no corrosion as in the case with metalcased wipers. For the groove recess fine fitting is not required.

- Good wear resistance.
- Smooth running due to optimum lubricant-retaining sealing lip geometry.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Product geometry prevents dirt deposits at the front face of the cylinder.
- Installation in closed and undercut housings.

Range of Application

Suitable for axially operated rods in pneumatic cylinders, plungers and rod guides.

Working temperature	
A2 NBR N3587	-30 °C to +80 °C
A2 PUR P5008	-35 °C to +80 °C
Surface speed	≤ 2 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

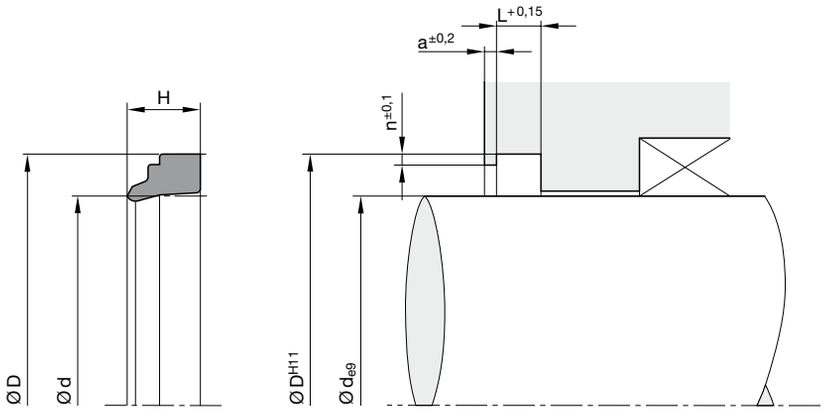
Compounds

Standard: N3587, NBR compound (≈90 Shore A)
for low temperatures: N8613, NBR compound (≈ 80 Shore A)
for high temperatures: V3664, FKM compound (≈ 85 Shore A)
Standard: P5008, PUR compound (≈ 94 Shore A)
for low temperatures: P5009, PUR compound (≈ 94 Shore A)

Installation

A2 wiper rings are supplied as continous rings. Any pressure on the back of the rings should be avoided.
Intermediate sizes may easily be manufactured from the next largest ring with the same cross-section. For this, the ring should be cut at an angle of 90° to the circumfence length (+2 to 3 % in excess). Due to the excess length, the two ends will fit closely together so that no gap will occur. Gluing is not necessary. The wiper may easily be pressed into the groove recess with a resulting tight fit.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The profile PP pneumatic cushioning seal is specially designed for cushioning spears in pneumatic cylinders.

- No mechanical check valves required since their function is performed by the cushioning rings.
- High cushioning consistency due to automatic centering, even in the case of misalignment of the cushioning spear and the cylinder head.
- Optimum use of design-related cushion travel.
- Robust seal profile for harshest operating conditions.
- Immediate response to reversed direction thanks to incorporated venting channels.
- Extreme wear resistance.
- Easier installation.
- Excellent media resistance in case of suitable compound selection.
- Installation in closed housings.

Range of Application

(pressure peaks during cushioning process considered)

Working pressure	≤ 16 bar [1)]
Working temperature	
PP NBR N3589	-30 °C to +80 °C
PP PUR P5008	-35 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

[1)] Higher pressure peaks during cushioning process considered.

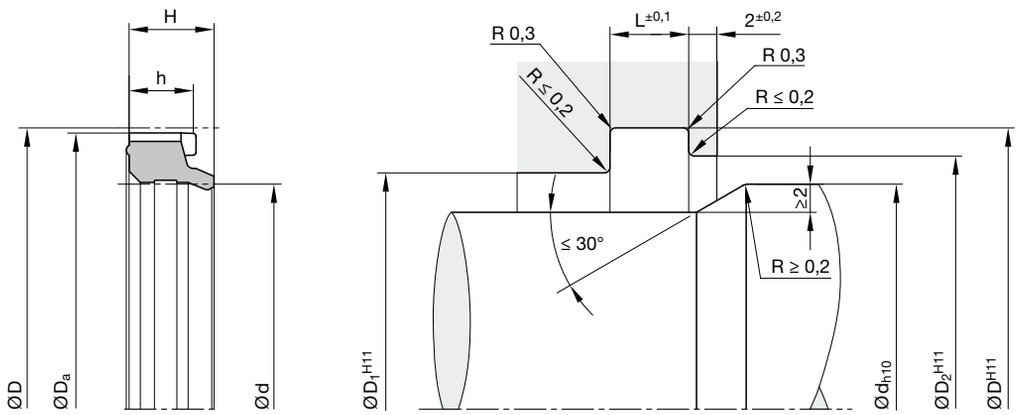
Compounds

Standard: N3589, NBR compound (≈ 85 Shore A)
for low temperatures: N8613, NBR compound (≈ 80 Shore A)
for high temperatures: V3839, FKM compound (≈ 90 Shore A)
Standard: P5008, PUR compound (≈ 94 Shore A)
for low temperatures: P5009, PUR compound (≈ 94 Shore A)

Installation

The profile PP cushioning seals are easily snapped into the groove, which should be free of all contaminants and foreign particles before installation. Care should be taken that the sealing lips are not damaged by sharp edges during installation.
Initial lubrication is essential for very long service life.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The profile V6 pneumatic cushioning seal is specially designed for cushioning spears in pneumatic cylinders.

- No mechanical check valves required since their function is performed by the cushioning rings.
- Optimum use of design-related cushion travel.
- Good wear resistance.
- Easier installation.
- High temperature resistance in case of suitable compound selection.
- Excellent media resistance in case of suitable compound selection.
- Immediate response to reversed direction thanks to incorporated venting channels.
- Short axial assembly length.
- Short radial assembly depth.
- Installation in closed and undercut housings.

Range of Application

For pneumatic cylinders with end-position cushioning.

Working pressure	≤ 16 bar [1)]
Working temperature	-30 °C to +80 °C
Surface speed	≤ 1 m/s
Media	Oiled as well as oil-free compressed air (after initial lubrication during assembly).

[1)] Higher pressure peaks during cushioning process considered.

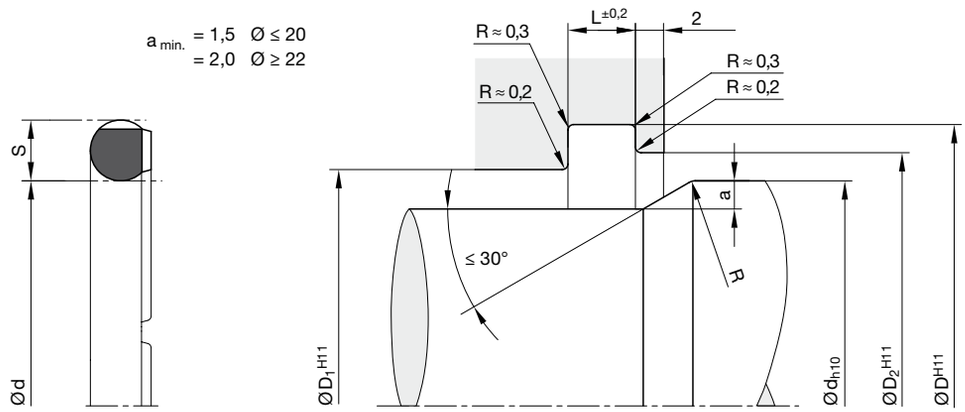
Compounds

Standard: N3578, NBR compound (≈ 75 Shore A)
for low temperatures: N8613, NBR compound (≈ 80 Shore A)
for high temperatures: V3839, FKM compound (≈ 90 Shore A)

Installation

For the cushioning spear (Ø d) we recommend a surface finish of R_t = 2 to 3 µm with flattened or polished process traces. The groove bottom (Ø D^{H11}) should not exceed surface finish of R_t = 10 µm with flattened or polished traces.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

The PTFE guidance tape profile F2 is specially designed for use in pneumatic cylinders.

- Due to application-optimized geometry and compounds suitable for use in oiled as well as in oil-free air (after initial lubrication on assembly).
- Vibration absorption effect.
- Very good emergency running properties in low-lube conditions.
- High load capacity (compressive strength), low wear and reduced friction due to special carbon additive in PTFE material.
- Dimensions according to ISO 10766.
- Also available as bulk material.
- Suitable for cylinder repairs.
- Ideally suited for large-diameter.
- Bulk material.
- Installation in closed housings.

Range of Application

Working temperature	-100 °C to +200 °C
Surface speed	≤ 10 m/s

Compounds

Polon® 033, PTFE + 25 % carbon.

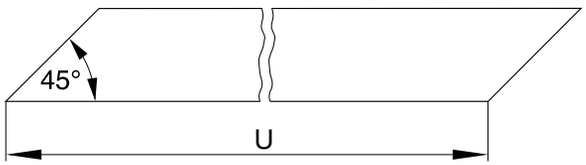
Installation

The gap dimensions “e” guarantee an optimum service life of the guiding tapes. For the seals, however, the gaps as mentioned on the respective catalogue pages are to be considered when it is essential to observe full working conditions (“Range of Application”).

The inner diameter of the groove can be calculated by:
d = D - 2S.
The gap “e” between cylinder and piston is the maximum value and should not be exceeded.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.

Calculation of the stretched length “U”



The length “U” of the tape is to be calculated from the mean circumferential length less the clearance at the joint “k”. The k-values stated in the table are based on a temperature rise of 120 °C.

Cyl.	Stretched length U		Gap
Ø D^{H11}	Piston	Tol.	k
≤ 45	$U = \pi \cdot (D - S) - k$	± 0.25	1.8
> 45		± 0.40	3.5
> 80		± 0.60	4.4
> 100		± 0.80	5.6
> 125		± 1.00	6.6
> 150		± 1.20	8.0
> 180		± 1.40	9.5
> 215		± 1.60	12.0
> 270		± 1.80	15.5
> 330		± 2.00	19.0

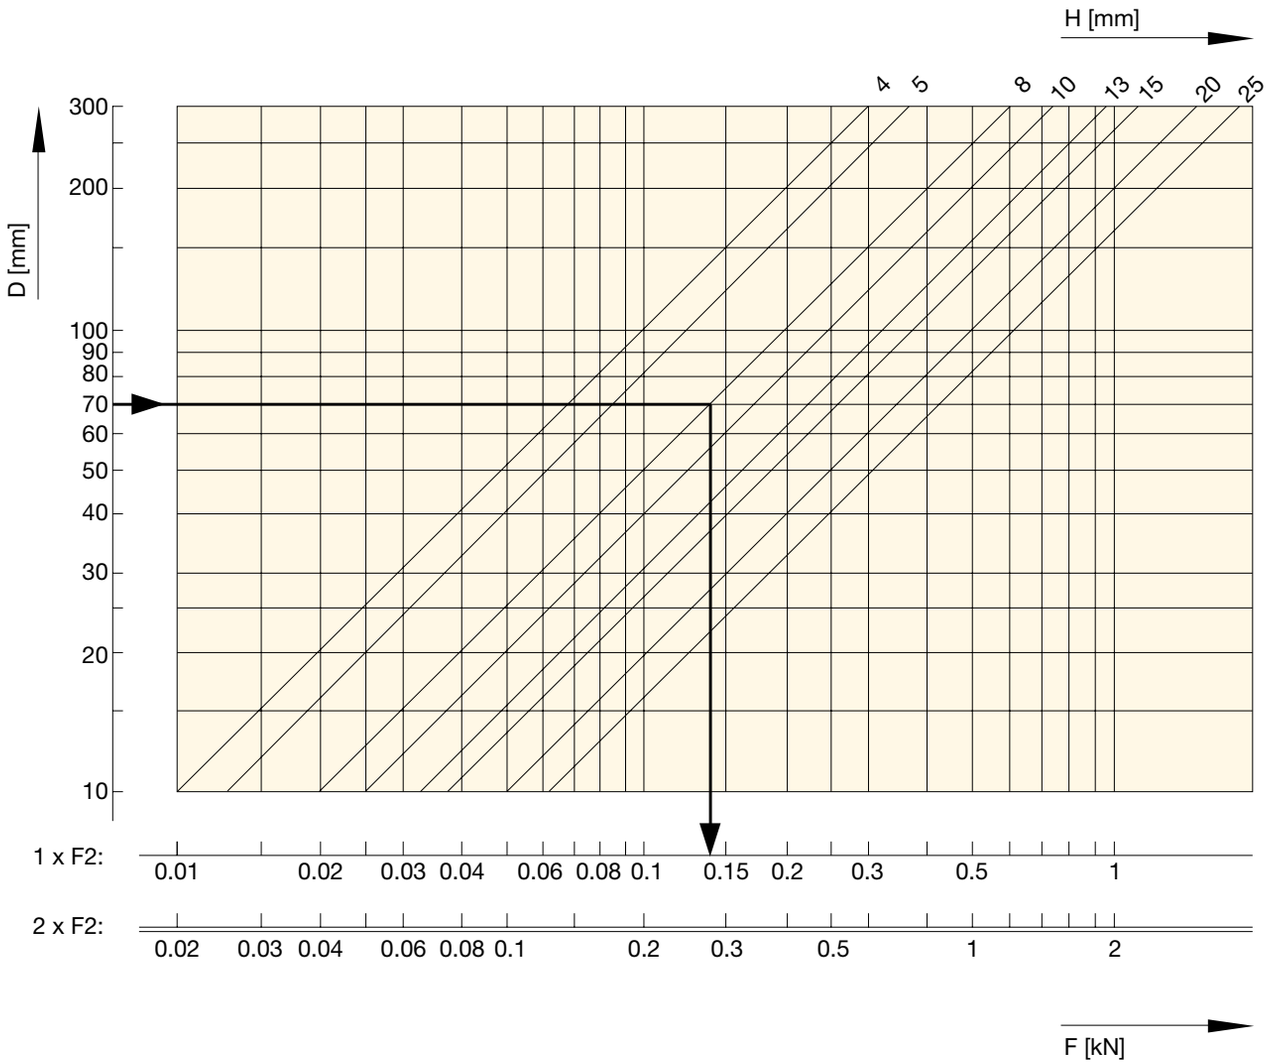
Selection of the guiding height H

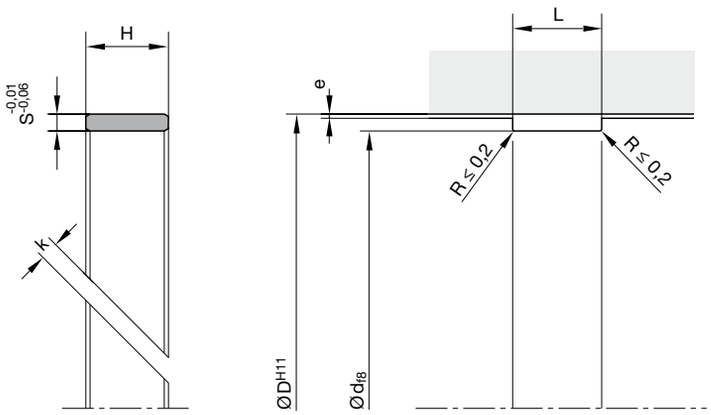
The height H of the guiding tape has to be calculated for the worst possible conditions considering the maximum radial force. The specific load at the tape in case of operating temperatures of ≤ 100 °C should not exceed $q = 2.5\ N/mm^2$. The calculation of this figure is based on the area from the projection of the height H of the guiding tape multiplied by the cylinder diameter D. The maximum permissible radial force $F_{perm.}$ can be obtained with the formula: $F_{perm.} = H \times D \times q_{perm.}$

Specific data can be found in the nomograph.

Example:
A guiding tape diameter D of 70 mm and a guiding tape height of 8 mm result in a maximum permissible radial force of 0.14 kN or 140 N.

Nomograph for calculating of the specific load





For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.

Ultrathan® O-rings are made from an in-house developed polyurethane compound with a very low compression set.
This low compression set made it possible to produce polyurethane O-rings. An O-ring made of polyurethane material is more resistant to extrusion than standard O-rings, so that it may be favourably used in all applications with very high pulsating pressures, or with restricted housing space not allowing the use of back-up rings.
Due to the high abrasion resistance, polyurethane O-rings are well suited for dynamic applications. Very good results have been achieved e.g. with air valves sealing at pilot pistons or at the main spool dynamic sealing system. Also in applications with short stroke positioning and clamping cylinders, and in valves for systems operated with poorly lubricating HFA fluids.
Polyurethane O-rings are used for control purposes; an example is the crossing of drill ports during which O-rings made of rubber elastomers are vulnerable to abrasive wear, significantly shortening their service life.

- Robust seal profile for harshest operating conditions.
- Extreme wear resistance.
- Suitable for fully automatic installation
- Insensitive to pressure peaks.
- High extrusion resistance.
- Excellent media resistance in case of suitable compound selection.
- Suitable compounds available for special requirements of the chemical process industry.
- Suitable compounds available for special requirements of the food processing industry.
- Installation in closed and undercut housings.
- Can be used in existing O-ring grooves.
- Low compression set.
- Machined small-volume series and samples available with short lead times.

Range of Application

The Ultrathan® O-rings are used when the physical properties of other compounds are insufficient.
Mainly for the sealing of cylinders, controls and valves.

Working pressure	≤ 600 bar [1)]
Working temperature	
Hydraulics	-35 °C to +100 °C
in water, HFA and HFB fluids	-35 °C to +50 °C
Pneumatics	-35 °C to +80 °C
Surface speed	≤ 0.5 m/s
Media	Mineral-oil based hydraulic oils, HFA and HFB fluids.

[1)] With reduced extrusion gap and suitable cross-section.

Compounds

The compound P5008 is a Parker standard material based on polyurethane with a Shore A hardness of approx. 93. Its main advantages in comparison with other polyurethane materials currently available on the market are the increased heat resistance and the lower compression set.
For fluids containing water, we recommend our hydrolysis-resistant compounds P5000, P5001, P5012 and P5070.

Installation

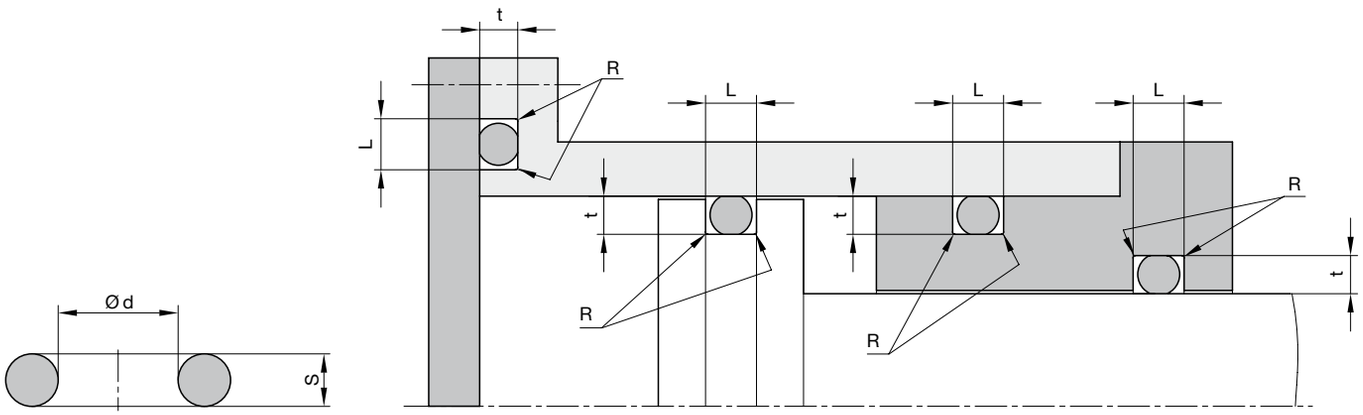
Due to the higher modulus of the polyurethane compounds, the housings are slightly different from those of standard O-rings.
All edges should be rounded by at least R = 0.1.
In the case of special applications, please discuss your problems with our Consultancy Service.

For dynamic applications the following minimum cross-sections apply:

S = 5.7 mm up to diameter d ≤ 150 mm
S = 7.0 mm up to diameter d ≤ 200 mm

Polyurethane O-rings show no tendency to twisting.

In case of special operating conditions (specific pressure loads, temperature, speed, use in water, HFA, HFB fluids etc.), please contact our consultancy service for a selection of the material and design best suiting your particular application requirements.



For surface finish, lead in chamfer and other installation dimensions see “General installation guidelines”.
